Drawn cup bearings of nominal inch dimensions, with one closed end, that are not tabulated, may be made available upon request.

Mounting dimensions are based on the inner ring rotating and the outer ring being stationary relative to the load. The housing should be of high strength material. See engineering section for discussion of shaft and housing design.

\* Further reduces shaft diameter.

## NEEDLE ROLLER BEARINGS

### EXTRA-PRECISION BEARINGS –

#### INCH SERIES

Open end full complement mechanically retained drawn cup needle roller bearings, manufactured to inch standards, are offered with extra-precision specifications. The manufacturing tolerance of these bearings is one-third that of the precision bearings. In production operations using closer tolerances on shaft and housing, they will assemble with consistently lower radial internal clearances than can be expected with the precision series bearings.

Extra-precision bearings are suitable for those applications requiring close control of radial play and eccentricity. They are also preferred when two bearings are mounted adjacent to each other since the greater accuracy in manufacture will provide better load distribution between the bearings.

Nominal dimensions, load ratings, limiting speeds and other general specifications for extra-precision bearings are the same as for the corresponding “B” or “BH” sizes of drawn cup needle bearings. Consequently, the data on pages C66 to C79 can be used in bearing size selection.

When ordering an extra-precision bearing, add the prefix letter “G” to the bearing designation. For example, after following the size selection procedure outlined in the engineering section, bearing B-1212 is selected, but extra-precision tolerances are required. These are designated by ordering a GB-1212 bearing.

To realize the advantages of the expected closer radial internal clearance of the extra-precision bearing, the user must have the capability of producing housing bore and shaft raceway diameters to the close tolerances indicated by the tabular data on the facing page.

The resulting total radial internal clearance within the installed GB-1212 extra-precision drawn cup needle roller bearing will lie in the range from 0.0002 in. to 0.0012 in.

Inspection dimensions for the extra-precision bearings are given in the table at the right. Note that these bearings must be inspected while mounted in the specified ring gage. Bearing bores are checked with “GO” and “NO GO” plug gages. The “GO” gage size is the minimum diameter inside the needle rollers. The “NO GO” gage size is 0.0001 in. larger than the maximum diameter inside the needle rollers.

Procedures for selecting ring and plug gage dimensions are the same as for those involving precision needle bearings, except that the ring gage diameters and diameters inside the needle rollers must be drawn from the table on this page.

| Nominal Inch Shaft Diameter | Gaging    |                                |        |
|-----------------------------|-----------|--------------------------------|--------|
|                             | Ring Gage | Diameter Inside Needle Rollers |        |
|                             |           | Min.                           | Max.   |

# NEEDLE ROLLER BEARINGS

## CAGED BEARINGS – OPEN ENDS, CLOSED ONE END INCH SERIES

J,JH

MJ-1, MJH-1

Mounting dimensions are based on the inner ring rotating and the outer ring being stationary relative to the load. The housing should be of high strength material. See engineering section for discussion of shaft and housing design. See page C62 for mounting procedure.

| Shaft Diameter | Dimensions mm/in. |        |        |      | Bearing Designation | Load Ratings kN/lbf. |        | Limiting Speed |       | C <sub>g</sub> |
|----------------|-------------------|--------|--------|------|---------------------|----------------------|--------|----------------|-------|----------------|
|                | F <sub>w</sub>    | D      | C      | Y    |                     | Dynamic              | Static | Grease         | Oil   |                |
| in.            | F <sub>w</sub>    | D      | C      | Y    | C                   | C <sub>0</sub>       | RPM    |                |       |                |

# NEEDLE ROLLER BEARINGS

## CAGED BEARINGS – OPEN ENDS, CLOSED ONE END – *continued*

### INCH SERIES

J, JH

MJ-1, MJH-1

Mounting dimensions are based on the inner ring rotating and the outer ring being stationary relative to the load. The housing should be of high strength material. See engineering section for discussion of shaft and housing design. See page C62 for mounting procedure.

| Shaft Diameter | Dimensions mm/in. |        |        |      | Bearing Designation | Load Ratings kN/lbf. |        | Limiting Speed |                | C <sub>g</sub> |        |
|----------------|-------------------|--------|--------|------|---------------------|----------------------|--------|----------------|----------------|----------------|--------|
|                | F <sub>w</sub>    | D      | C      | Y    |                     | Dynamic              | Static | Grease         | Oil            |                |        |
| in.            | F <sub>w</sub>    | D      | C      | Y    | C                   | C <sub>0</sub>       | RPM    |                | C <sub>g</sub> |                |        |

# NEEDLE ROLLER BEARINGS

## CAGED BEARINGS – OPEN ENDS, CLOSED ONE END – *continued*

### INCH SERIES

J, JH

MJ-1, MJH-1

Mounting dimensions are based on the inner ring rotating and the outer ring being stationary relative to the load. The housing should be of high strength material. See engineering section for discussion of shaft and housing design. See page C62 for mounting procedure.

| Shaft Diameter | Dimensions mm/in. |        |        |      | Bearing Designation | Load Ratings kN/lbf. |                | Limiting Speed |      | C <sub>g</sub> |        |
|----------------|-------------------|--------|--------|------|---------------------|----------------------|----------------|----------------|------|----------------|--------|
|                | F <sub>w</sub>    | D      | C      | Y    |                     | Dynamic              | Static         | Grease         | Oil  |                |        |
| in.            | F <sub>w</sub>    | D      | C      | Y    |                     | C                    | C <sub>0</sub> | RPM            |      |                |        |

Mounting dimensions are based on the inner ring rotating and the outer ring being stationary relative to the load. The housing should be of high strength material. See engineering section for discussion of shaft and housing design. See page C62 for mounting procedure.

C

# NEEDLE ROLLER BEARINGS

## SEALED DRAWN CUP BEARINGS

### INCH SERIES

- Check for availability. Not all bearings are in production.
- Prepacked with general purpose ball and roller bearing grease unless otherwise specified.
- Bearing operating temperature limited between -25° F and +225° F.
- Consult your Timken representative for operating temperatures outside the above range or if seals exposed to unusual fluids.
- Limiting speed based on shaft contact speed of 2000 RPM.
- Reduce the listed limiting speed by one-half for outer ring rotation.

Drawn cup bearings of nominal inch dimensions, with one seal and one end closed, may be made available upon request.

Mounting dimensions are based on the inner ring rotating and the outer ring being stationary relative to the load. The housing should be of high strength material. See engineering section for discussion of shaft and housing design. See page C62 for mounting procedure.

| Shaft Diameter | Dimensions mm/in.       |                         |                       | Bearings With One Seal mm/in. |                       | Bearings With Two Seals mm/in. |                     |                       |

# NEEDLE ROLLER BEARINGS

## INNER RINGS FOR INCH SERIES DRAWN CUP BEARINGS

- Check for availability.
- Ideal choice where shaft not practical to use as inner raceway.
- Provided in inch (IR, IRA) nominal dimensions for use with inch series drawn cup bearings.
- Designed to meet established inch tolerances.
- Designed to be wider than matching drawn cup bearing.
- Maximum shaft fillet radius ( $r_{as-max}$ ) cannot exceed inner ring bore chamfer ( $r_{s-min}$ ) as shown.
- Optional centralized lubrication groove (bore) or thru-hole available – specify when ordering.
- Designed to be axially clamped against shoulder for loose transition fit on shaft.
- After mounting, for tight transition fit (keeping inner ring from rotating relative to shaft), inner ring O.D. must not exceed raceway diameter on matching bearing.
- See tables for required bearing dimensions raceway diameter.
- After mounting, if O.D. of inner ring exceeds required raceway diameter for matching bearing, ring should be ground to proper diameter while mounted on shaft.
- Unmarked end of inner ring to be assembled against shaft shoulder to assure clearing maximum allowable shaft fillet ( $r_{as max}$ ) as indicated in tables shown.

| Shaft Diameter | Dimensions mm/in. |        |        |        |        |        |             | Inner Ring Designation | Transition Fit |            |            |            | Wt. mm/lbs. Approx. |

Bore and O.D. tolerance limits correspond to the single mean diameter (the arithmetical mean of the largest and smallest diameters in a single radial plane).  
 \* $r_{as max}$  is equal to minimum inner ring bore chamfer ( $r_{s min}$ ) at unmarked end.

# NEEDLE ROLLER BEARINGS

## INNER RINGS FOR INCH SERIES DRAWN CUP BEARINGS

- Check for availability.
- Ideal choice where shaft not practical to use as inner raceway.
- Provided in inch (IR, IRA) nominal dimensions for use with inch series drawn cup bearings.
- Designed to meet established inch tolerances.
- Designed to be wider than matching drawn cup bearing.
- Maximum shaft fillet radius ( $r_{as-max}$ ) cannot exceed inner ring bore chamfer ( $r_{s-min}$ ) as shown.
- Optional centralized lubrication groove (bore) or thru-hole available – specify when ordering.
- Designed to be axially clamped against shoulder for loose transition fit on shaft.
- After mounting, for tight transition fit (keeping inner ring from rotating relative to shaft), inner ring O.D. must not exceed raceway diameter on matching bearing.
- See tables for required bearing dimensions raceway diameter.
- After mounting, if O.D. of inner ring exceeds required raceway diameter for matching bearing, ring should be ground to proper diameter while mounted on shaft.
- Unmarked end of inner ring to be assembled against shaft shoulder to assure clearing maximum allowable shaft fillet ( $r_{as max}$ ) as indicated in tables shown.

| Shaft Diameter | Dimensions mm/in. |                  |                  |                  |                  |                  |               | Inner Ring Designation | Transition Fit   |                  |                  |                  | Wt. mm/lbs. Approx. |

Bore and O.D. tolerance limits correspond to the single mean diameter (the arithmetical mean of the largest and smallest diameters in a single radial plane).  
 $r_{as max}$  is equal to minimum inner ring bore chamfer ( $r_{s min}$ ) at unmarked end.

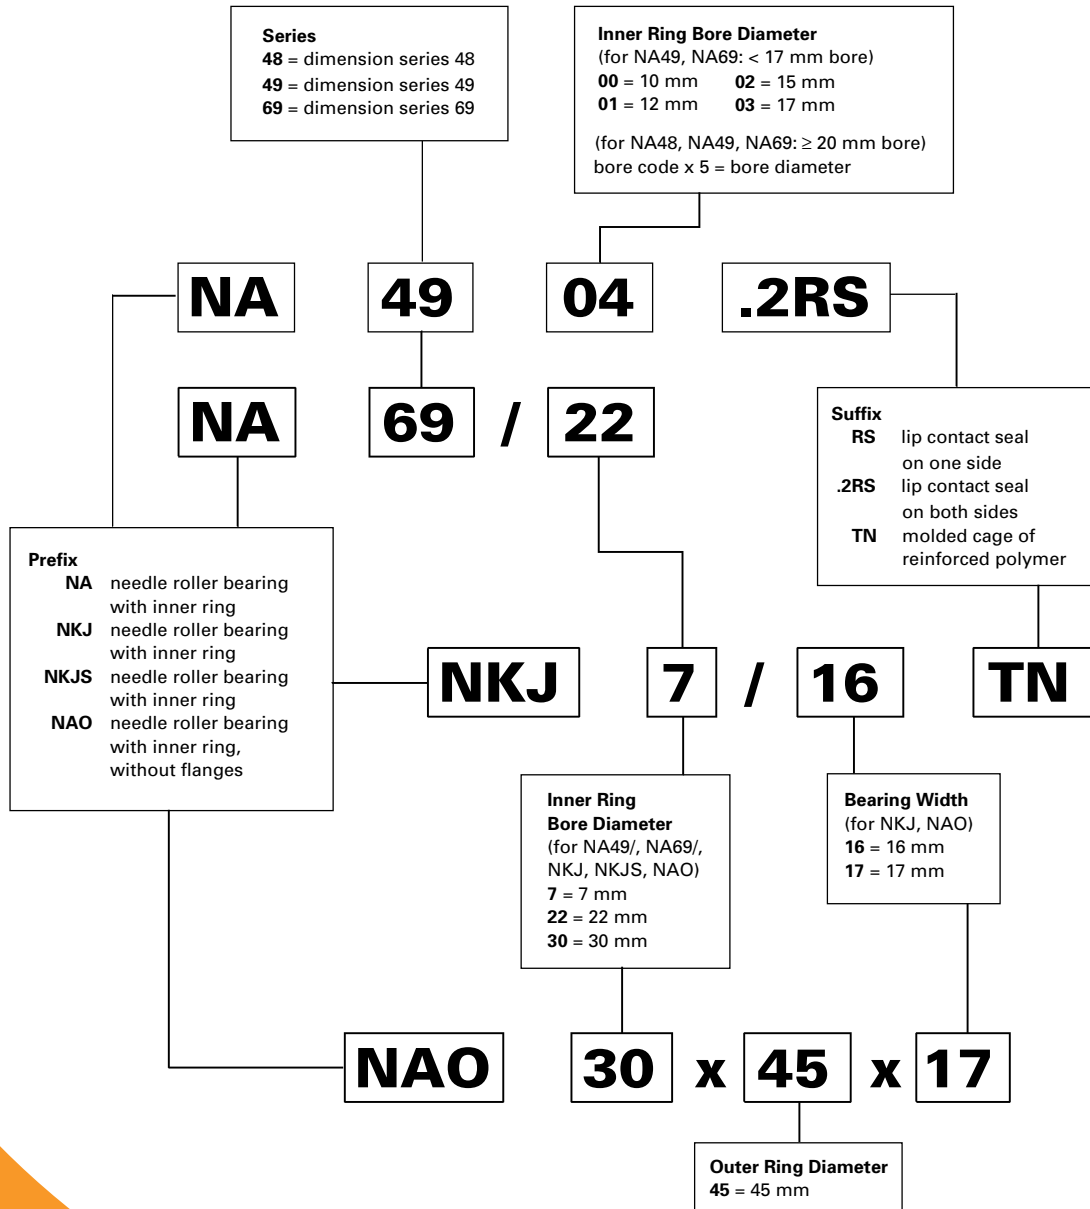

## HEAVY-DUTY NEEDLE ROLLER BEARINGS

**Overview:** Heavy-duty needle roller bearings consist of a machined and ground channel-shaped outer ring with a complement of needle rollers retained and guided by a cage. The high-strength cage retains and guides the rollers. An optional lubrication groove and hole in the outer ring facilitate relubrication. These bearings can be used with or without a machined and ground inner ring, depending on the suitability of the shaft as a raceway surface.

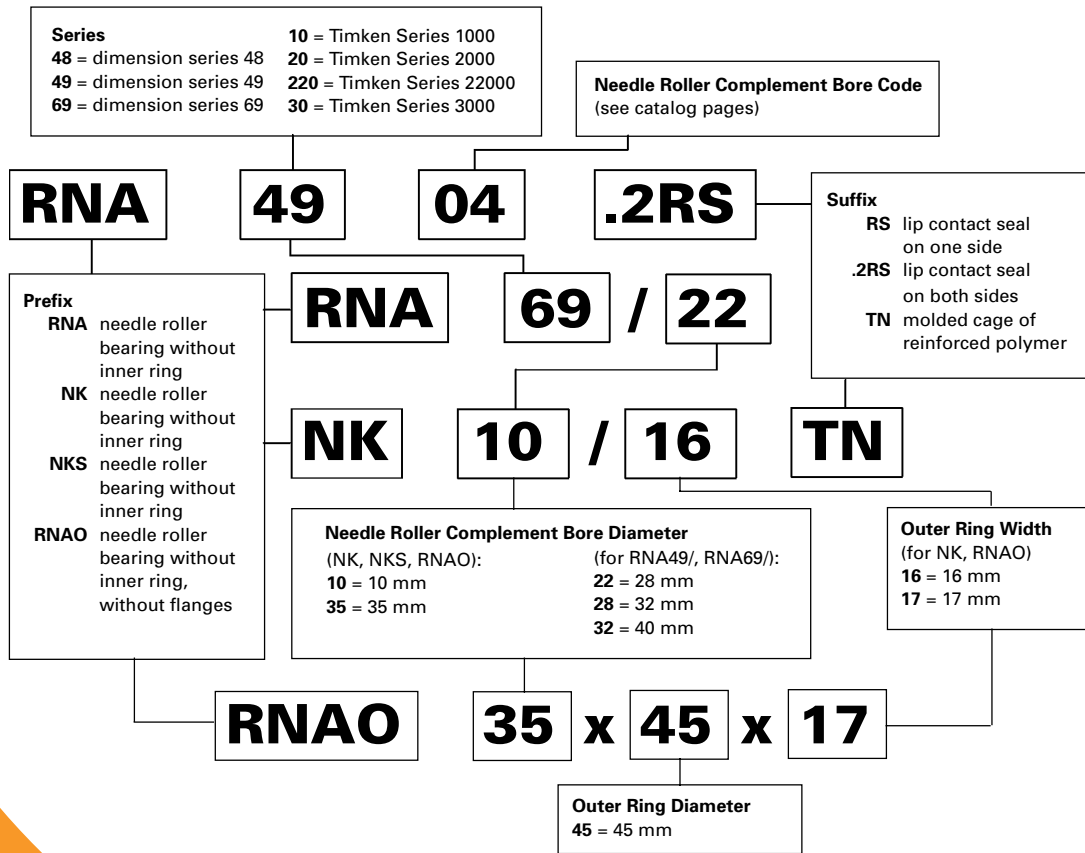

- **Sizes: Metric:** 5 mm - 175 mm bore (0.19685 in. - 6.88976 in.).
- **Markets:** Gear pumps, sheaves, automotive transmissions and two-cycle engines.
- **Features:** Thick outer ring provides maximum load capacity and shock resistance with a relatively small radial cross section.
- **Benefits:** Optimum speed and lubrication-retention capability.

# NEEDLE ROLLER BEARINGS

## NEEDLE ROLLER BEARINGS

### METRIC SERIES

When applications involve very heavy dynamic, static or even shock load conditions the needle roller bearing may be found to give best results.

### REFERENCE STANDARDS ARE:

- ISO 1206 – Needle roller bearings – Light and medium series – Dimensions and tolerances.
- DIN 617 – Rolling bearings – Needle roller bearings with cage – Dimension Series 48 and 49.

### TYPES OF METRIC SERIES NEEDLE ROLLER BEARINGS Needle roller bearings with inner rings

**NKJ**  
( $d \leq 7$  mm)

**NKJ, NKJS**  
( $d \geq 9$  mm)  
NA48, NA49  
NA69 ( $d \leq 30$  mm)

**NA69**  
( $d \geq 32$  mm)

**Full Complement**

### Needle roller bearings without inner rings

**NK**  
( $F_w \leq 10$  mm)

**NK** ( $F_w \geq 12$  mm)  
NKS, RNA48, RNA49  
RNA69 ( $F_w \leq 35$  mm)

**RNA69**  
( $F_w \geq 40$  mm)

without flanges,  
with inner rings**

**Needle roller bearings  
without flanges, without  
inner rings**

**Suffixes**

|             |                                              |
|-------------|----------------------------------------------|
| <b>RS</b>   | One Seal                                     |
| <b>.2RS</b> | Two Seals                                    |
| <b>TN</b>   | Molded Cage of Engineered Reinforced Polymer |

**CONSTRUCTION**

The basic constructions of metric series needle roller bearings are:

- with integral end flanges on the one piece channel-shaped outer rings. ( $F_w \geq 12$  mm)
- with inserted end washers to provide axial retention of the needle roller and cage assemblies. ( $F_w \leq 10$  mm)
- without flanges where separate end washers or housing shoulders are required to provide axial retention of the needle roller and cage assemblies.
- full, outer ring-piloted complement of needle rollers (with or without inner ring).

**METRIC SERIES NEEDLE ROLLER BEARINGS WITH INNER RINGS**

When it is impractical to finish the shaft to meet the desired raceway design requirements, an inner ring may be used. Standard needle roller bearings are available with inner rings (such as the NA Series) forming complete bearings. Bearings furnished with inner rings meet the quality requirements in accordance with ISO standards.

- For inner and outer ring tolerances the metric series bearings follow the normal tolerance class in ISO Standard 492 covering radial bearings. Bearings to more precise tolerance classes P6 and P5 may be obtained upon request (see the engineering section).
- The metric series bearings may be obtained with radial internal clearance in accordance with ISO Standard 5753 also specified for cylindrical roller bearings. Mostly, they follow the normal (C0) radial clearance group although bearings to clearance groups C2, C3, and C4 may be made available on request (see the engineering section).
- Inner ring and outer ring chamfer dimensions meet the requirements of ISO Standard 582.

**METRIC SERIES NEEDLE ROLLER BEARINGS WITHOUT INNER RINGS**

Whenever the shaft can be used as the inner raceway, needle roller bearings without inner rings provide advantages of economy and close control of radial internal clearance in operation. Tolerance class F6 is the normal specification for the metric series needle roller complement bore diameter of an unmounted bearing as shown in Table 1. In the case of needle roller bearings of series RNAO, without flanges and without inner rings, the outer rings and needle roller and cage assemblies are not interchangeable.

TABLE 1 – METRIC SERIES CAGED NEEDLE ROLLER COMPLEMENT BORE DIAMETER FOR BEARINGS WITHOUT INNER RINGS.

| mm    |     | μm               |      |
|-------|-----|------------------|------|
| >     | ≤   | low              | high |

### METRIC SERIES NEEDLE ROLLER BEARINGS WITH INTEGRAL FLANGES

The Timken® Torrington® needle roller bearing has a one-piece channel-shaped outer ring of bearing quality steel, heat treated to yield maximum load rating. The integral end flanges provide axial location for the needle rollers. The bores of the end flanges serve as piloting surfaces for the cage.

A steel cage provides inward retention for the needle rollers and the design assures roller stability and minimizes friction between the cage and the needle rollers. The cage has maximum strength consistent with the inherent high load ratings of needle roller bearings.

Needle roller bearings of series NKJ, NKJS, NA48, and NA49 contain one needle roller and cage assembly, bearings of series NA69 with bearing bores of 32 mm and above have two needle roller and cage assemblies.

The outer ring has a lubricating groove and a lubricating hole for more convenient lubrication of the bearing. However, the smaller bearings of series NKJ and NK do not have a lubricating groove or a lubricating hole. ( $F_w \leq 10 \text{ mm}$ )

### METRIC SERIES NEEDLE ROLLER BEARINGS WITH INSERTED END WASHERS

Some metric series needle roller bearings have inserted end washers to provide axial retention of the needle roller and cage assembly. The needle roller and cage radial assemblies, consistent with other Timken Torrington designs, provide inward and outward retention for the needle rollers.

### METRIC SERIES NEEDLE ROLLER BEARINGS WITHOUT FLANGES

The needle roller and cage radial assembly used in the metric series needle roller bearings without flanges is slightly narrower than the inner and outer rings to ensure unobstructed operation. Separate end washers are required to provide axial retention of the needle roller and cage radial assembly. Wide needle roller bearings using two needle roller and cage assemblies have a lubricating

groove and one lubricating hole in the outer ring to facilitate relubrication of the bearing. Narrow needle roller bearings do not have a lubricating groove or a lubricating hole in the outer ring.

### SEALED METRIC SERIES NEEDLE ROLLER BEARINGS OF DIMENSION SERIES 49

Needle roller bearings of Series 49 are available with one or two integral lip contact seals as listed on page C118. One seal is designated by suffix letters RS. Two seals are designated by .2RS. When combining sealed metric series needle roller bearings with inner rings it is suggested to use inner rings shown on page C340 with designation JRZ because they are wider than the outer rings to ensure positive seal contact.

These seals limit the bearing operating temperature between  $-30^\circ \text{C}$  and  $110^\circ \text{C}$ . If the operating temperature must be outside the above range or if the seals are exposed to unusual fluids, external seals using suitable seal materials or other solutions should be investigated. Sealed bearings are normally packed with a high quality lithium soap base grease suitable up to  $120^\circ \text{C}$  for short periods of operation.

The limiting speeds specified for sealed bearings listed in the bearing tables are based on operating conditions determined by testing. Optimum performance may be expected providing the bearing is properly installed, with appropriate internal clearances, and be subjected to a load of low magnitude. Care should be taken that overheating will not occur, thus preventing breakdown of the grease and eventual bearing failure.

### METRIC SERIES FULL COMPLEMENT NEEDLE ROLLER BEARINGS

Series NA and RNA 1000, 2000, 22000 and 3000 are available with possible options of extra wide and/or crowned inner ring raceways. Consult your local Timken representative for application details.

## BEARING MOUNTING

### MOUNTING DIMENSIONS

It is suggested that needle roller bearings are mounted in their housings with a clearance fit if the load is stationary relative to the housing, or with a tight transition fit if the load rotates relative to the housing. Table 2 lists the suggested tolerances for the housing bore and the shaft raceway for metric series bearings without inner rings. Table 3 lists the suggested shaft tolerances for the above two mounting conditions when the metric series bearings are used with inner rings. The suggested housing bore tolerances for metric series bearings with inner rings is the same as the housing bore tolerance listed in Table 2 for metric series bearings without inner rings. Other quality requirements for shafts and housings are given in the engineering section of this catalog.

Other mounting dimensions may be required for special operating conditions such as:

1. Extremely heavy radial loads
2. Shock loads
3. Temperature gradient across bearing
4. Housing material with heat expansion coefficient different than that of the bearing
5. Oscillating motion applications

## Heavy-Duty Needle Roller Bearings

Regardless of the fit of the bearing outer ring in the housing, the outer ring should be axially located by housing shoulders or other positive means. The bearing rings should closely fit against the shaft and housing shoulders and must not contact the fillet radius. The maximum shaft or housing fillet  $r_{as\ max}$  should be no greater than the minimum bearing chamfer  $r_{s\ min}$  as shown in Table 4.

In order to permit mounting and dismounting of the shaft, the maximum diameter  $D_1$  in Table 5 must not be exceeded.  $F_w$  is shown in the bearing tables.

**TABLE 2 – MOUNTING TOLERANCES FOR METRIC SERIES BEARINGS WITHOUT INNER RING**

| Rotation conditions                 | Nominal housing bore diameter D<br>mm | ISO tolerance zone for housing |      | Nominal shaft diameter F<br>mm | ISO tolerance zone for shaft |      |
|-------------------------------------|---------------------------------------|--------------------------------|------|--------------------------------|------------------------------|------|
|                                     |                                       | caged                          | full |                                | caged                        | full |
| Load stationary relative to housing | all diameters                         | H7                             | J6   | all diameters                  | h6                           | h5   |
| General work with larger clearance  | all diameters                         | K7                             | —    | all diameters                  | g6                           | —    |
| Load rotates relative to housing    | all diameters                         | N7                             | M6   | all diameters                  | f6                           | g5   |

NOTE: Care should be taken that the selected bearing internal clearance is appropriate for the operating conditions. Details of shaft and housing quality requirements are given in the engineering section of this catalog.

**TABLE 3 – SHAFT TOLERANCES FOR METRIC SERIES BEARINGS WITH INNER RINGS (USE HOUSING TOLERANCE SHOWN IN TABLE 2)**

| Rotation conditions                 | Nominal shaft diameter d, mm |      | ISO tolerance zone for shaft |         |
|-------------------------------------|------------------------------|------|------------------------------|---------|
|                                     | caged                        | full | caged                        | full    |
| load rotates relative to housing    | all diameters                |      | g6                           | h5 (h6) |
| load stationary relative to housing | >                            | ≤    |                              |         |
|                                     | 40                           | 100  | k6                           | k5      |
|                                     | 100                          | 140  | M6                           | M5      |
|                                     | 140                          |      | n6                           | n6      |

NOTE: Care should be taken that the selected bearing internal clearance is appropriate for the operating conditions. Details of shaft and housing quality requirements are given in the engineering section of this catalog.

Needle roller bearings without flanges of series RNAO and NAO must have the needle roller and cage radial assembly properly end guided by shoulders as shown in Table 6, or other suitable means such as the spring steel washers (SNSH) shown on page C349. These end guiding surfaces should be hardened and precision turned or ground to minimize wear and should properly fit against the outer rings and the inner rings to provide the desired end clearance for the needle roller and cage assembly.

## LOAD RATING FACTORS

### DYNAMIC LOADS

Needle roller bearings can accommodate only radial loads.

$$P = F_r \quad (\text{kN})$$

P = The maximum dynamic radial load that may be applied to a needle roller bearing based on the dynamic load rating C given in the tabular pages. This load should be  $\leq C/3$ .

### STATIC LOADS

Needle roller bearings can accommodate only radial loads.

$$P_0 = F_r \quad (\text{kN})$$

### MOUNTING IN SETS

Needle roller bearings which are mounted side by side or must have the same cross-section and radial internal clearances, after mounting.

## SINGLE ROW RADIAL BEARINGS –

### METRIC SERIES

The cylindrical roller radial bearing has integral end ribs on the outer ring for end guiding the cylindrical rollers. The inner ring is separable for simplified mounting and removal.

All NU design bearings are available on request without inner rings. For this requirement add letter R in the prefix.

The modified line contact between the cylindrical rollers and raceways reduces edge stressing.

### REFERENCE STANDARDS ARE:

- DIN 5412 single-row cylindrical roller bearings.
- ISO 246 & DIN 5412 Angle rings (thrust collar).

|--------------|------------------------------------------------------------------|
| <b>E.TVP</b> | E-design bearing, molded window type cage of engineered polymer. |
| <b>M</b>     | Machined brass cages.                                            |

### CONSTRUCTION

Cylindrical roller radial bearings can be recognized by the arrangement of their end ribs. Bearings of NU design have two ribs on the outer ring, the inner ring being cylindrical, which makes them well-suited for use as floating bearings. They are separable, which simplifies mounting and removal. Cylindrical roller radial bearings of NJ design have two ribs on the outer ring and one rib on the inner ring. They can accept axial loading in one direction.

Bearings of NUP design have two ribs on the outer ring, and one fixed and one loose rib (a flat washer) on the inner ring. These cylindrical roller radial bearings are used for locating purposes and can accept reversing axial loading. A cylindrical radial roller bearing of NJ design with an HJ Type thrust collar forms a locating bearing similar to the NUP design.

Cylindrical roller bearings of RNU Type, available on request, are supplied without an inner ring so that the cylindrical rollers run directly on a hardened and ground shaft. For most general applications the shaft may be machined to g6 and the housing bore to K6 tolerances.

### CAGE DESIGNS

Cylindrical roller bearings of series 2..E, 22..E, 3..E and 23..E mostly use cages of glass fiber reinforced nylon. This cage construction allows for bearings to be designed with maximum load carrying capability. These cages can be used at operating temperatures of up to 120° C over extended periods. When bearings are lubricated with an oil, presence of additives may reduce operating life if the temperature exceeds 100° C over extended periods. Furthermore, stagnant oil may affect the performance of the cage at these temperatures, requiring oil change intervals to be strictly observed.

Suffix M indicates that the bearings use machined brass cages.

CYLINDRICAL ROLLER TYPES NU, NUP AND NJ,  
SEE THE RADIAL CYLINDRICAL SECTION**

## NEEDLE ROLLER BEARINGS

### DIMENSIONAL ACCURACY

#### TOLERANCES AND BEARING CLEARANCE

Metric series cylindrical roller radial bearings are available in various tolerance classes and clearance groups. Single row cylindrical roller bearings are made to normal clearance group C0 although bearings with radial clearance groups C2, C3 and C4 may be obtained on request.

For tolerances of cylindrical roller radial bearings see page B336. For radial internal clearances of cylindrical roller radial bearings see page B336.

#### ALIGNMENT

The modified line contact between the cylindrical rollers and raceways of cylindrical roller bearings reduces stress concentration at ends of the rollers and provides some aligning capability. The angular alignment of single row cylindrical roller bearings must not exceed a maximum of 4 angular minutes at a load of  $P/C < 0.2$  ( $P$  = equivalent dynamic load, kN.) At higher applied loads, or with presence of greater misalignment, consultation with your Timken representative is strongly encouraged.

#### MOUNTING DIMENSIONS

The bearing inner and outer rings should be mounted against the stepped portion on the shaft and the shoulder of the housing. Under no circumstances should they interfere with the shaft or housing fillets. For this reason the maximum fillet radius  $r_{as\ max}$  of the mating component must be no greater than the minimum chamfer dimension of the corresponding cylindrical roller bearing ring corner  $r_{s\ min}$ .

The shoulder of the mating components must be such that, even with the maximum permissible single chamfer dimension of the corresponding bearing ring, there is an adequate contact surface area. Table 1 lists the maximum fillet radius  $r_{as\ max}$  and the minimum shoulder height. At high axial loads the ribs must be supported over half their height.

$$\left( \frac{H + E}{2} \text{ and } \frac{F + J}{2} \right)$$

where from bearing tables:

- F** raceway diameter of the inner ring
- E** raceway diameter of the outer ring
- J** rib diameter of the inner ring
- H** rib diameter of the outer ring

The shaft can be mounted and removed if the mounting dimensions shown in Table 2 on page C135 are observed.

## NEEDLE ROLLER BEARINGS

### LOAD RATINGS

#### MAXIMUM CAPACITY BEARINGS

The maximum capacity cylindrical roller radial bearings are designated with a letter E in the suffix. The cylindrical rollers are designed for maximum load carrying capability and are available in bearings of series 2, 22, 3 and 23.

#### EQUIVALENT DYNAMIC LOADS

For cylindrical roller bearings with purely radial applied load:

$$P = F_r \text{ (kN)}$$

$$P = \text{Equivalent dynamic load (kN)}$$

$F_r$  = The maximum dynamic radial load that may be applied to a cylindrical roller bearing based on the dynamic load rating C given in the tabular pages. This load should be  $\leq C/3$ .

If, in addition to the radial load, an axial load  $F_a$  acts on the bearing, this axial load is taken into consideration when calculating the life of a bearing (with  $F_a \leq F_{az}$ ;  $F_{az}$  is the allowable axial load).

| Dimension Series | Load Ratio                              | Equivalent Dynamic Load                            |
|------------------|-----------------------------------------|----------------------------------------------------|
| 10, 2..E, 3..E   | $F_a/F_r \leq 0.11$<br>$F_a/F_r > 0.11$ | $P = F_r$<br>$P = 0.93 \cdot F_r + 0.69 \cdot F_a$ |
| 22..E, 23..E     | $F_a/F_r \leq 0.17$<br>$F_a/F_r > 0.17$ | $P = F_r$<br>$P = 0.93 \cdot F_r + 0.45 \cdot F_a$ |

#### ALLOWABLE AXIAL LOAD

Metric series cylindrical roller bearings of NUP, NJ, as well as NU or NJ designs with a thrust collar can transmit axial loads if they are radially loaded at the same time. The allowable axial load ratio  $F_a/C$  of 0,1 maximum depends to a great extent on the magnitude of radial load, the operating speed, type of lubricant used, the operating temperature and heat transfer conditions at the bearing location. The heat balance achieved at the bearing location is used as a basis for determination of the allowable axial load.

The nomogram on page C137 should be used to determine the allowable axial load  $F_{az}$  based on the following operating conditions:

- The axial load is of constant direction and magnitude
- Radial load ratio  $F_r/C \leq 0.2$
- Ratio of axial load to radial load  $F_a/F_r < 0.4$
- The temperature of the bearing is 80° C at an ambient temperature of 20° C.
- Lubricating oil is ISO VG 100 using oil bath lubrication or circulating oil.
- As an alternative, the bearing may be lubricated with a grease using the above specified base oil and viscosity. Use of EP additives will be necessary, although considerably shorter relubrication intervals may be expected than with purely radially loaded cylindrical roller radial bearings.

#### EXAMPLE OF USING THE NOMOGRAM

From the lower part of the nomogram, determine the intersection point of the inner ring bore diameter and the dimension series of the bearing. From the upper part, the allowable axial load ratio  $F_{az}/C$  can be found as a function of the operating speed, n.

For a cylindrical roller radial bearing **NU2207E.TVP**

$$C = 63 \text{ kN}; d = 35 \text{ mm}$$

$$n = 2000 \text{ RPM}$$

$$F_r = 10 \text{ kN}$$

From the nomogram:

$$F_{az}/C = 0.06$$

$$\text{Then } F_{az} = 0.06 \cdot 63$$

The calculated allowable axial load  $F_{az}$  is 3.78 kN

It should be noted that an axial load as high as that determined by means of the nomogram should not be applied if an oil of rated kinematic viscosity lower than ISO VG 100 is used. Suitable EP additives, which are known for fatigue life improving qualities, may allow for an increase in applied axial load subject to thorough testing.

#### HIGHER APPLIED AXIAL LOADS

Axial loads greater than those determined by means of the nomogram may be considered, providing they are to be applied intermittently. Also, the bearing should be cooled using circulating oil lubrication and if the operating temperature, due to the internal friction and the higher axial load, exceeds 80° C, a more viscous oil must be used.

#### EQUIVALENT STATIC LOAD

For cylindrical roller radial bearings with radially applied static loads

$$P_0 = F_r \text{ (kN)}$$

C

## NEEDLE ROLLER BEARINGS

### NEEDLE ROLLER BEARINGS –

#### INCH SERIES

When there is a requirement for a rolling bearing to support very high dynamic, static or even shock loads with a restricted mounting space, the needle roller bearing may be found to give best results.

#### REFERENCE STANDARDS ARE:

- **ANSI/ABMA Standard 18.2** – Needle Roller Bearings – Radial, Inch Design.
- **ASTM Standard F 2246** – Standard Specification for Bearing, Roller, Needle: Thick Outer Ring with Rollers and Cage.
- **Military Standard MS 51961** – Bearing, Roller, Needle: Thick Outer Ring with Rollers and Cage.

## C

### IDENTIFICATION

HJ

IR

HJ – .2RS

The prefix letters HJ in the needle roller bearing designation denote that the bearing is manufactured to inch nominal dimensions.

Bearings are available with one or two lip contact seals as listed on pages C148-C149. One seal is designated by suffix letters RS. Two seals are designated by .2RS.

Inner rings can be used with HJ Series needle roller bearings for applications where it is impractical to use the shaft as the inner raceway. These inch series inner rings are identified by the prefix letters IR.

Since the entire identification code may not appear on the bearing itself, the manufacturer's parts list or another reliable source should always be consulted when ordering bearings for service or field replacement, to make certain that the correct bearing with the correct lubricant is used.

### CONSTRUCTION

The HJ Series needle roller bearing has a one-piece channel-shaped outer ring of bearing quality steel, heat treated to provide maximum load rating. The integral end flanges provide axial location for the needle rollers. The bores of the end flanges serve as piloting surfaces for the cage, locating it to prevent removal of the lubricant film on the raceway.

These bearings have a steel cage which provides inward retention for the needle rollers. The design assures roller stability and minimizes friction between the cage and the needle rollers. The cage has a maximum strength consistent with the inherent high load ratings of needle roller bearings.

The needle rollers are made from high carbon chrome steel, through-hardened, ground and lapped to close tolerance with controlled contour for optimum load distribution.

One Piece Channel-Shaped, Outer Ring

## DIMENSIONAL ACCURACY, BEARINGS – INCH SERIES

Tolerances for the HJ bearings are given in Tables 1 and 2.

Pages C142-C149 list the nominal outside diameter, width and needle roller complement bore diameter for the HJ bearings.

TABLE 1 – OUTSIDE DIAMETER AND WIDTH TOLERANCES, HJ BEARINGS

<sup>(1)</sup> "The smallest single diameter of the roller complement bore" is defined as the diameter of the cylinder which, when used as a bearing inner ring, results in zero radial internal clearance in the bearing on at least one diameter.

# NEEDLE ROLLER BEARINGS

## DIMENSIONAL ACCURACY, INNER RINGS –

### INCH SERIES

Tolerances for the IR inner rings are given in Table 3 and 4. Pages C150-C153 list the nominal outside diameter, width and bore diameter for the IR series inner rings.

TABLE 3 – BORE AND WIDTH TOLERANCES, IR INNER RING

| d<br>Nominal Outside Diameter |         |        |        | Deviations from Nominal<br>of Single Mean Outside Diameter, $d_{mp}^{(1)}$ |        |      |          |       |       |        |        |

(1) "Single mean diameter" is defined as the mean diameter in a single radial plane.

## LUBRICATION

The outer rings of the HJ bearings are supplied with a lubrication groove on the O.D. and a lubrication hole in this groove to facilitate relubrication through the outer ring. The IR inner rings have lubrication grooves in the bore and a relubrication hole to facilitate relubrication through the inner ring.

HJ Series bearings (with or without seals) are typically shipped protected with a corrosion preventive compound which is not a lubricant. When specified by the customer, HJ Series bearings may be ordered prelubricated with suitable greases and oils. For general information regarding lubrication of needle roller bearings, refer to the engineering section.

## SEALS

Shaft contact seals which fit into the same housing bore as the heavy-duty needle roller bearings may be obtained from recognized seal manufacturers. Bearings can also be made available with one or two integral seals — for information and listing of sealed bearings see pages C148-C149.

## SPECIAL BEARINGS

For needle roller bearings with special dimensions or special features such as split outer ring, consult the Timken automotive representative.

## MOUNTING DIMENSIONS

HJ needle roller bearings are normally mounted in their housings with a clearance fit if the load is stationary relative to the housing, and with a tight transition fit if the load rotates relative to the housing. Since the tight transition fit of the bearing in its housing may result in a reduction of the needle roller complement bore diameter, the shaft raceway diameter should be reduced a like amount.

The tables of dimensions list the suggested ISO H7 tolerances for the housing bore and the suggested ISO h6 tolerances for the shaft raceway when the outer ring is to be mounted with a clearance fit. They also list the suggested ISO N7 tolerances for the housing bore and the suggested ISO f6 tolerances for the shaft raceway when the outer ring is to be mounted with a tight transition fit.

Other mounting dimensions may be required for special conditions such as:

1. Extremely heavy radial loads
2. Shock loads
3. Load rotating relative to both inner and outer rings
4. Temperature gradient across bearing
5. Housing with heat expansion coefficient differing from that of the bearing.

If these conditions are expected, please consult your Timken

representative.

Regardless of the fit of the bearing outer ring in the housing, the outer rings should be axially located by housing shoulders or other positive means. The bearing rings should closely fit against shaft and housing shoulders and must not contact the fillet radius. The maximum shaft or housing fillet  $r_{as\ max}$  should be no greater than the minimum bearing chamfer  $r_{s\ min}$  shown in the bearing tables. The unmarked end of the outer ring should be assembled against the housing shoulder to assure clearing the maximum housing fillet. Similarly, the unmarked end of the inner ring should be assembled against the shaft shoulder to assure clearing the maximum shaft fillet.

## LOAD RATING FACTORS

### DYNAMIC LOADS

Needle roller bearings can accommodate only radial loads.

$$P = F_r$$

P = The maximum dynamic radial load that may be applied to a needle roller bearing based on the dynamic load rating C given in the tabular pages. This load should be  $\leq C/3$ .

### STATIC LOADS

Needle roller bearings can accommodate only radial loads.

$$P_0 = F_r$$

C

# NEEDLE ROLLER BEARINGS

## HJ TYPE

### INCH SERIES

- Check for availability.
- Nominal bearing diameters and widths shown.
- Tolerance tables found on page C139.
- Clearance fit suggested for outer ring when housing is stationary relative to load.
- Tight transition fit suggested if housing rotates relative to load.
- See page C141 for further discussion on mounting practices.
- Consult your Timken representative for oscillating applications (e.g., low radial clearance concerns).
- Unmarked end of outer ring should be assembled against housing shoulder to clear maximum allowed housing fillet ( $r_{as\ max}^*$ ).
- Meets Military Standard MS 51961.

\*r<sub>as max</sub> is equal to the minimum bearing chamfer (r<sub>s min</sub>) at unmarked end.  
 (1) C<sub>g</sub> factor for bearing without inner ring

# NEEDLE ROLLER BEARINGS

## HJ TYPE – continued

### INCH SERIES

- Check for availability.
- Nominal bearing diameters and widths shown.
- Tolerance tables found on page C139.
- Clearance fit suggested for outer ring when housing is stationary relative to load.
- Tight transition fit suggested if housing rotates relative to load.
- See page C141 for further discussion on mounting practices.
- Consult your Timken representative for oscillating applications (e.g., low radial clearance concerns).
- Unmarked end of outer ring should be assembled against housing shoulder to clear maximum allowed housing fillet ( $r_{as\ max}^*$ ).
- Meets Military Standard MS 51961.

\*r<sub>as max</sub> is equal to the minimum bearing chamfer (r<sub>s min</sub>) at unmarked end.  
 (1) C<sub>g</sub> factor for bearing without inner ring.

## NEEDLE ROLLER BEARINGS

### HJ TYPE – continued

#### INCH SERIES

- Check for availability.
- Nominal bearing diameters and widths shown.
- Tolerance tables found on page C139.
- Clearance fit suggested for outer ring when housing is stationary relative to load.
- Tight transition fit suggested if housing rotates relative to load.
- See page C141 for further discussion on mounting practices.
- Consult your Timken representative for oscillating applications (e.g., low radial clearance concerns).
- Unmarked end of outer ring should be assembled against housing shoulder to clear maximum allowed housing fillet ( $r_{as\ max}^*$ ).
- Meets Military Standard MS 51961.

## NEEDLE ROLLER BEARINGS

### SEALED HEAVY-DUTY NEEDLE ROLLER BEARINGS

#### INCH SERIES

- Bearing diameters and widths listed are nominal.
- For inspection purposes, see tolerance tables on page C139.
- Available with one or two contact lip seals designed to retain lubricant and exclude foreign material.
- Single seals are normally installed in the stamped end of bearing.
- Seals limit the bearing operating temperature between -25° F and +225° F (-30° C and +110° C).
- For operating temperature outside of the above range, or if seals are exposed to unusual fluids, please consult your Timken representative.

\* $r_{as \max}$  is equal to the minimum bearing chamfer ( $r_{s \min}$ ) at unmarked end.

# NEEDLE ROLLER BEARINGS

## INNER RINGS

### INCH SERIES

- Check for availability.
- Ideal choice where shaft not practical to use as inner raceway.
- Provided in inch nominal dimensions for use with inch series heavy-duty needle roller bearings.
- Designed to meet established inch tolerances.
- Selected size should be wider than matching drawn cup bearing.
- Maximum shaft fillet radius ( $r_{s\ max}$ ) cannot exceed inner ring bore chamfer ( $r_{s\ min}$ ) as shown.
- Optional centralized lubrication groove (bore) or through-hole available – specify when ordering.
- Designed to be axially clamped against shoulder for loose transition fit on shaft.
- After mounting, for tight transition fit (keeping inner ring from rotating relative to shaft), inner ring O.D. must not exceed raceway diameter on matching bearing.

| Shaft Diameter | Dimensions mm/in. |        |       |       | Inner Ring Designation | Approx. Wt. kg/lbs. | Loose Transition Fit mm/in. |        | Inner Ring Designation | Interference Fit mm/in. |        | Used With Bearing Designation |

## Heavy-Duty Needle Roller Bearings

- See tables for required bearing dimensions raceway diameter.
- After mounting, if O.D. of inner ring exceeds the required raceway diameter for matching bearing, ring should be ground to proper diameter while mounted on shaft.
- Unmarked end of inner ring to be assembled against the shaft shoulder to assure clearing the maximum allowable shaft fillet ( $r_{as\ max}$ ) as indicated in tables shown.

| Shaft Diameter | Dimensions mm/in. |               |               |              | Inner Ring Designation | Approx. Wt. kg/lbs. | Loose Transition Fit mm/in. |               | Inner Ring Designation | Interference Fit mm/in. |               | Used With Bearing Designation |
|----------------|-------------------|---------------|---------------|--------------|------------------------|---------------------|-----------------------------|---------------|------------------------|-------------------------|---------------|-------------------------------|

# NEEDLE ROLLER BEARINGS

## INNER RINGS — *continued*

### INCH SERIES

- Check for availability.
- Ideal choice where shaft not practical to use as inner raceway.
- Provided in inch nominal dimensions for use with inch series heavy-duty needle roller bearings.
- Designed to meet established inch tolerances.
- Selected size should be wider than matching drawn cup bearing.
- Maximum shaft fillet radius ( $r_{s\ max}$ ) cannot exceed inner ring bore chamfer ( $r_{s\ min}$ ) as shown.
- Optional centralized lubrication groove (bore) or through-hole available – specify when ordering.
- Designed to be axially clamped against shoulder for loose transition fit on shaft.
- After mounting, for tight transition fit (keeping inner ring from rotating relative to shaft), inner ring O.D. must not exceed raceway diameter on matching bearing.

| Shaft Diameter | Dimensions mm/in. |                |              |              | Inner Ring Designation | Approx. Wt. kg/lbs. | Loose Transition Fit mm/in. |                | Inner Ring Designation | Interference Fit mm/in. |                | Used With Bearing Designation |

## Heavy-Duty Needle Roller Bearings

- See tables for required bearing dimensions raceway diameter.
- After mounting, if O.D. of inner ring exceeds the required raceway diameter for matching bearing, ring should be ground to proper diameter while mounted on shaft.
- Unmarked end of inner ring to be assembled against the shaft shoulder to assure clearing the maximum allowable shaft fillet ( $r_{as\ max}$ ) as indicated in tables shown.

| Shaft Diameter | Dimensions mm/in.        |                          |                       |                              | Inner Ring Designation | Approx. ## **NEEDLE ROLLER BEARINGS**

### **NOTES**

C

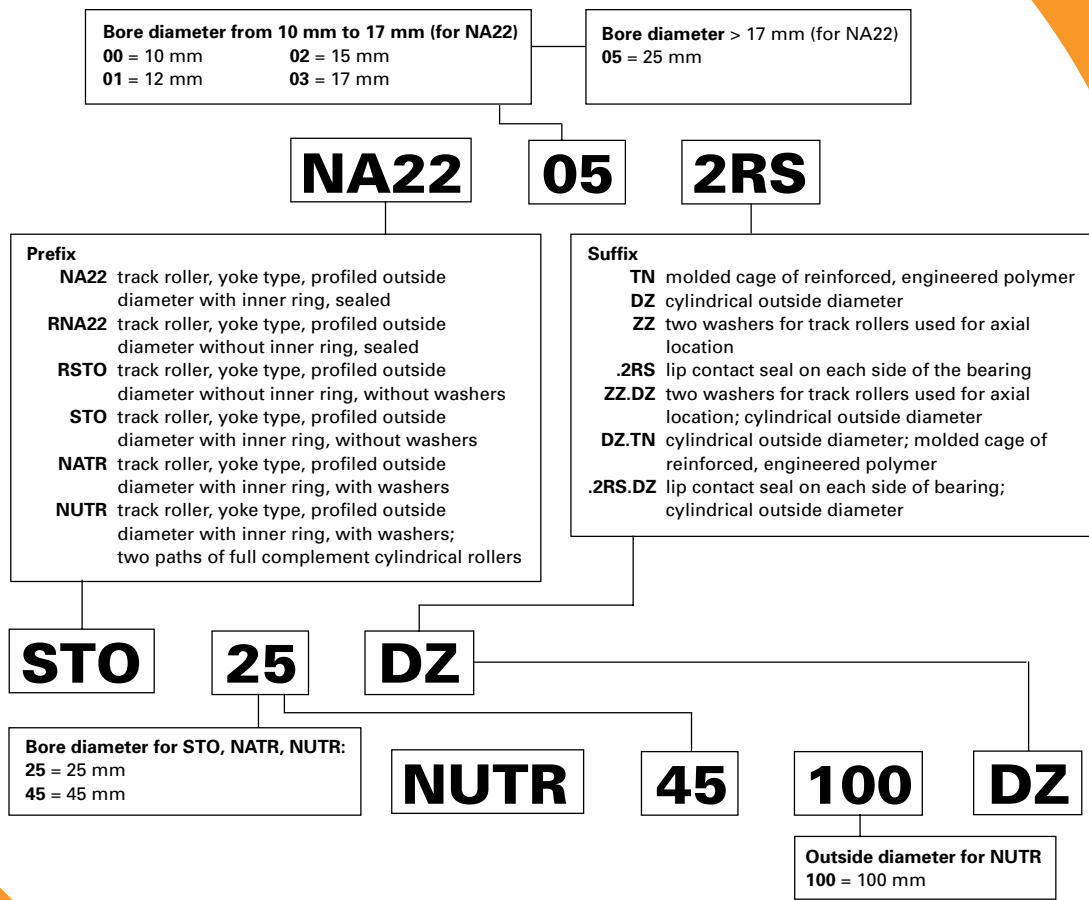

## TRACK ROLLERS

**Overview:** Track rollers (also known as cam followers) are characterized by their thick-walled outer rings that run directly on a track. The thick outer rings permit high load-carrying capability while minimizing both distortion and bending stresses. Sealed designs with internal thrust washers help extend service life under conditions of infrequent lubrication.

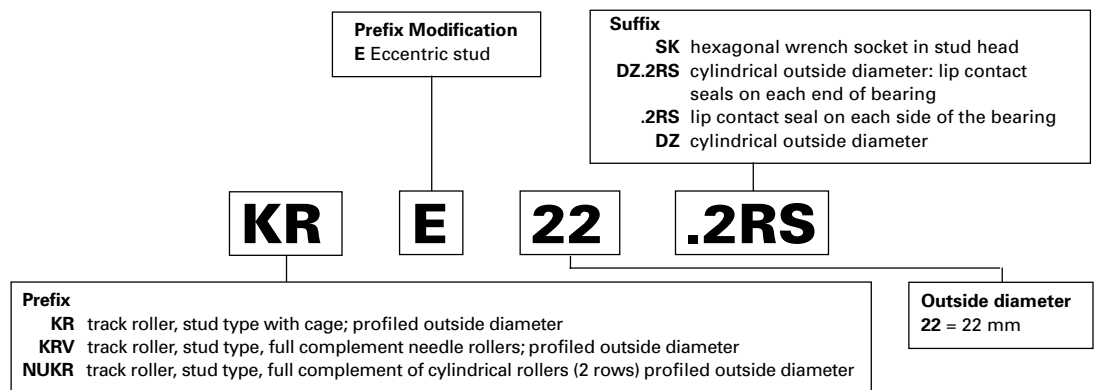

- **Sizes:** 16 mm - 110 mm (1/2 in. - 4 in.) bore.
- **Markets:** Ram support rollers, material handling and indexing equipment.
- **Features:** Available in two basic designs: with an inner ring for straddle mounting in a yoke or with an integral stud for cantilever mounting.
- **Benefits:** High load-carrying capability with minimized distortion and bending stresses. Extended service life under conditions of infrequent relubrication.

## NEEDLE ROLLER BEARINGS

### STUD TYPE AND YOKE TYPE TRACK ROLLERS – METRIC SERIES

Timken track rollers listed in this catalog have been designed with outer rings of a large radial cross section to withstand heavy rolling and shock loads on track type or cam-controlled equipment. The outside diameters of the outer rings are either profiled or cylindrical. Profiled track rollers are designed to alleviate uneven bearing loading resulting from deflection, bending or misalignment in mounting.

Stud type track rollers are available in various open designs, as well as with lip contact seals or metal shields.

Yoke type track rollers are designed for straddle mounting. The various metric series designs are grouped and organized as illustrated below.

#### REFERENCE STANDARDS ARE:

- **ISO 6278** – Needle roller bearings – Track rollers – Boundary dimensions
- **ISO 492** – Radial bearings – Tolerances
- **DIN 620** – Tolerances of Ball and Roller Bearings
- **ISO 281** – Rolling bearings – Dynamic load ratings and rating life

## CONSTRUCTION

### STUD TYPE TRACK ROLLERS

The metric series stud type track roller is a non-separable unit, consisting of a large radial cross-section outer ring, needle roller and cage radial assembly or a full complement of needle or cylindrical rollers, a stud and a retaining washer securely fastened to the stud.

The seals on the sealed stud type track rollers are located in the counterbores of the outer ring and seal against the stud flange and the retaining washer, providing good retention of lubricant and exclusion of foreign material. The seals are thermally stable in a temperature range between -30° C and 110° C.

A screwdriver slot (standard) or a hexagonal wrench socket (customer requested) in the head of the stud facilitates mounting. Wrench sizes are listed on the dimensional tables where found among certain GC Series sizes on pages later in this section. Other metric series hexagonal socket sizes are listed in Table 1.

TABLE 1 –  
HEXAGONAL SOCKET – METRIC SERIES

| Stud Type Track Roller<br>Outside Diameter |    | Dimensions |     |
|--------------------------------------------|----|------------|-----|
| ><br>mm                                    | ≤  | SW         | t   |

|                                            | 90 | 17         | 10  |

### ECCENTRIC STUDS FOR STUD TYPE TRACK ROLLERS

To provide radial adjustment of the outer ring toward the track or cam surface at the time of installation, some metric series stud type track rollers are available with eccentric studs which are specified by adding the letter "E" to the designation letters: KRE and NUKRE. The GCR and GCUR Series include an eccentric bushing added to the track roller stud. Appropriate dimensions of the eccentric stud bushing are listed in Table 2 and 2A.

Since a track roller with an eccentric stud is usually adjusted upon installation by turning the stud in the mounting hole, a close clearance fit between the outside diameter of the bushing and the mounting hole is necessary. For turning the stud, a hexagonal wrench is generally more convenient than a screwdriver, thus, the option of a hexagonal wrench socket in the head of the stud should be considered.

Some applications may require more secure positioning than provided by the tightened stud nut. If so, it is recommended that the mounting hole and the eccentric bushing be drilled at the time of installation to accept a locating dowel pin.

TABLE 2 –

## NEEDLE ROLLER BEARINGS

### YOKE TYPE TRACK ROLLERS

#### METRIC SERIES YOKE TYPE TRACK ROLLERS WITHOUT END WASHERS

These yoke type track rollers are available with a profiled or a cylindrical outside diameter of the outer ring, and with or without a separable inner ring. Since they are supplied without end washers, their outer rings must be guided by the adjacent end locating surfaces. Tolerance class F6 is the normal specification for the bore of the metric series needle roller and cage radial assemblies used with these yoke type track rollers.

#### YOKE TYPE TRACK ROLLERS – SERIES RSTO & STO

Series STO have a separable inner ring and when the inner ring is removed they become series RSTO. They run directly on a hardened and ground inner raceway. Quality requirements for inner raceways are given in the engineering section of this catalog.

#### SEALED YOKE TYPE TRACK ROLLERS WITHOUT END WASHERS – SERIES RNA 22.2RS & NA22.2RS

These yoke type track rollers have the same bore diameter and outside diameter as most of the other metric series yoke type track rollers listed in this catalog. The thick section outer ring is made of one-piece channel-shaped bearing quality steel, heat treated to yield maximum load carrying capability. The integral end flanges provide axial guidance for the large diameter needle rollers, and a cage supplies their inward retention. These track rollers have two integral lip contact seals designated by .2RS. The seals are thermally stable in a temperature range between -30° C and 110° C. Care should be exercised when mounting track rollers without inner rings onto inner raceways to avoid damage to the seals. Inner raceway quality requirements are given in the engineering section of this catalog.

#### METRIC SERIES YOKE TYPE TRACK ROLLERS WITH END WASHERS

These yoke type track rollers are available with a crowned or a cylindrical outside diameter of the outer ring. Metric series yoke type track rollers with end washers, depending on the internal construction, may be end guided, either through the end washers or between the end faces of the rollers and the inside faces of the outer ring flanges.

#### YOKE TYPE TRACK ROLLERS – SERIES NATR & STO.ZZ

The series NATR yoke type track rollers are of non-separable design consisting of a crowned or a cylindrical outer ring, caged needle rollers, an inner ring and two retaining end washers securely fastened to the inner ring. The series STO.ZZ yoke type track rollers are of separable design with two loose end washers. These end washers placed in the counter bores of the outer ring form very effective labyrinth type shields, providing good retention of lubricant and exclusion of foreign material. A lubrication hole in the inner ring enables relubrication when a cross-drilled bolt or shaft, which can be serviced from the end, is used.

#### YOKE TYPE TRACK ROLLERS – SERIES NUTR

The series NUTR yoke type track rollers are of non-separable design consisting of a profiled or cylindrical outer ring, two rows of full complements of cylindrical rollers, an inner ring, two retaining end washers and two shields. The outer ring is located axially through the cylindrical rollers.

A lubricating hole in the inner ring enables relubrication when a cross-drilled bolt or shaft, which can be serviced from the end, is used.

The smallest track roller of this series has an outside diameter of 35 mm. NUTR yoke type track rollers are well suited to carry high loads and designs with a thicker outer ring are particularly suitable for high shock loads. Designs with thicker outer ring have a larger outside diameter which can be identified by the bearing designation (e.g., NUTR 1542).

#### YOKE TYPE TRACK ROLLERS – SERIES FP AND FG

The FP and FG non-separable inner ring designs are available in profiled or cylindrical outer rings. Both employ a full complement of needle rollers and require relubrication via a pathway through the shaft. The FP Series is the smallest series available and is not offered with seals.

#### YOKE TYPE TRACK ROLLERS – SERIES FGU (LIGHT AND HEAVY TYPES)

The FGU non-separable inner ring designs are available in profiled or cylindrical outer rings. All FGU Series use a full complement of cylindrical rollers between the inner and outer rings and require relubrication via a pathway through the shaft. The FGU Heavy series uses a thicker outer ring section and are capable of higher loads.

Both FGU Series are only available with a metal shield for a roller sealing option.

#### YOKE TYPE TRACK ROLLERS – SERIES RNA, RNAB, RNAL

The RNA and RNAB Series design use a full complement of needle rollers retained with a pair of end washers. A separate, matching inner ring is listed in the tables of part numbers. The RNAL Series use a cylindrical outer ring and is only offered in limited sizes.

C

### DIMENSIONAL ACCURACY

The tolerances of the basic metric series caged roller and NUKR stud type and yoke type track rollers whose outer rings have a cylindrical outside diameter, correspond to tolerances specified in ISO-492 Radial bearings - Tolerances. The outer ring tolerances given in Table 4 apply to the outer rings used in the caged roller and NUKR stud type and caged roller and NUTR yoke type, metric series, track rollers. Metric series track rollers with a crowned outside diameter are the exception: their outside diameter tolerances is 0-0.05 for all caged roller sizes and NUTR, NUKR types. The remaining types have h9 tolerance on profiled outer diameters and h7 for straight diameters. Stud diameter and stud length tolerances are

TABLE 3 – TOLERANCES FOR STUD DIAMETER AND STUD LENGTH – METRIC SERIES

| Stud Diameter mm |     |                  |     | Stud Length mm |                 |

given in Table 3. The inner ring tolerances given in Table 5 apply to inner rings used in metric series caged roller, NUKR Series yoke type track rollers.

### MOUNTING STUD TYPE TRACK ROLLERS

When the stud shank of a metric series stud type track roller is mounted in a hole of tolerance H7, the installation force should be applied only to the center portion of the flanged end of the stud, preferably with an arbor press. The surface of the hole in the machine element which supports the stud must not deform under the expected load, and the support should be sufficiently rigid to resist bending loads. Deformation and bending will cause uneven loading of the outer ring.

In mounting the stud type track roller, the retaining washer must be firmly backed up by a flat shoulder which is square with the stud center line. The shoulder diameter must be no smaller than the minimum clamping diameter, d<sub>a</sub> listed in the tabular data.

The maximum inherent strength of the stud is obtained when the track roller is supported as close as possible to the retaining washer, which minimizes the bending moment. For this reason the edge of the housing which supports the stud shank should be kept as sharp as practical, but free from burrs.

The clamping nut should not be tightened with a torque value higher than the maximum listed. A screwdriver slot or hexagonal wrench socket in the flanged end of the stud is provided for a tool to prevent the stud from turning when the nut is being tightened. Hexagonal nuts are supplied with all metric series stud type track rollers.

## NEEDLE ROLLER BEARINGS

### YOKE TYPE TRACK ROLLERS

The machine element with the holes in which the mounting bolt or shaft is supported must be sufficiently rigid to resist local crushing under the applied load, and to resist bending which can cause uneven loading of the needle rollers.

When applied loads are high, the h6 or j6 tolerance should be used in conjunction with a high strength shaft or bolt for mounting metric series yoke type track rollers. When loads are moderate, a g6 tolerance may be used with a high strength shaft or bolt. For light loads, the loose transition fit with the f6 tolerance may be used with an unhardened shaft or bolt.

The yoke type track rollers with inner rings, also those with end washers as well as inner rings, should be clamped endwise between parallel faces perpendicular to the axis to prevent the

retaining washers from coming off under load. The dimensions of machine parts adjoining the metric series yoke type track rollers should be based on the minimum clamping diameter  $d_a$  to ensure that the washers are adequately supported. If the track roller cannot be end clamped, a close axial fit in the yoke is required. Care should be taken that the lubricating hole is located in the unloaded zone of the raceway.

The metric series yoke type track rollers without inner rings require a hardened and ground shaft or bolt with a k5 tolerance. Inner raceway quality requirements are given in the engineering section of this catalog.

C

## LOAD RATINGS

### DYNAMIC LOADING AS A TRACK ROLLER

When the outer ring of a stud type or yoke type track roller runs on a track, the contact, under a radial load, causes elastic (oval) deformation of the outer ring. As a result, a smaller zone of the raceway is loaded and the load is distributed on fewer needle rollers. This in turn affects the dynamic and static load ratings of the track rollers. Also, this deformation generates bending stress in the outer ring which must not exceed the maximum permitted for the material of the outer ring. The maximum permissible dynamic ( $F_{r\text{ perm}}$ ) radial load condition is determined by this requirement.

The rating life of stud type or yoke type track rollers should be calculated using the dynamic load ratings  $C_w$  shown in the tables. The tables also show the maximum permissible radial load,  $F_{r\text{ perm}}$  that can be dynamically applied on stud type or yoke type track rollers. However, to calculate the  $L_{10}$  life of a track roller, the applied radial load must not be greater than  $C_w/2$  based on ideal operating conditions of alignment, lubrication, temperature, speed, and accelerations.

### STATIC RATING AS A TRACK ROLLER

In addition to the basic static load rating  $C_0$ , the tables also list the maximum permissible static radial load  $F_{0r\text{ perm}}$  that may be applied to a stud type or yoke type metric series track roller. The values of  $F_{0r\text{ perm}}$  result in a calculated minimum static factor  $f_s$  of 0.7 for the worst condition of internal load distribution in metric series track roller operation. **The  $F_{0r\text{ perm}}$  values must not be exceeded.** The static factor  $f_s$  can be calculated using the following formula:

$$f_s \geq 0.7 \cdot \frac{F_{0r\text{ perm}}}{P_{0r}}$$

where

$F_{0r\text{ perm}}$  = Maximum permissible static radial load (kN)

$P_{0r}$  = Equivalent static load (kN)

$P_{0r} = F_{0r}$  for metric series track rollers

$F_{0r}$  = Static radial load (kN)

$f_s$  = Static factor whose values should not be smaller than those suggested in Table 6.

TABLE 6 – SUGGESTED VALUES FOR STATIC FACTORS  $f_s$  FOR METRIC SERIES TRACK ROLLERS

| Requirements For Yoke Type Track Rollers And Stud Type Track Rollers         | Suggested $f_s$ Values |
|------------------------------------------------------------------------------|------------------------|
| High shock-type loads                                                        |                        |
| Quiet running                                                                | 1.5...2.5              |
| Normal loading                                                               |                        |
| Normal quietness of running                                                  | 1...1.5                |
| Minor impact loads and rotary motion particularly quiet running not required | 0.7...1                |

## LUBRICATION OF STUD TYPE TRACK ROLLERS

Timken metric series stud type track rollers are supplied with a lithium soap based, general purpose grease. When the caged KR Series track rollers are operated at low speeds, with light loads and in clean environments, there often is no need to relubricate the track roller. In other applications, periodic relubrication may be necessary to obtain optimum performance. The full complement series of track rollers have less internal volume available for grease storage, therefore, they may require more frequent lubrication than caged type track rollers. Stud type track rollers, with a screwdriver slot in the flanged end of the stud, have provisions for relubrication through the flanged end of the stud. Metric series stud type track rollers with hexagonal sockets can not be relubricated from the flanged end of the stud. Both types of metric series stud type track rollers, with outside diameters larger than 22 mm (28 mm for all GC variations), allow for relubrication through the threaded end of the stud. In addition, caged roller and NUKR Series stud type track rollers with 30 mm and larger outside diameters allow for relubrication through a cross-drilled hole in the stud shank. The ends of the axial holes are counterbored to accept press-fit grease fittings of series VENN. The grease fittings are supplied with metric series stud type track rollers. Hole diameters ( $d_4$ ) for these grease fittings are listed in the tables of dimensions on pages later in this chapter as it applies. Note that the GC small series has no axial hole.

One or more plugs are supplied with every metric series stud type track roller to close off unused holes. At the flanged end, the plug must not be pushed in too deeply as it may cover the cross-drilled lubricating hole. The plug should be pressed in using an installation tool whose dimensions are given in Table 8. If the cross-drilled hole in the stud shank is not used, it will be covered when the track roller is properly installed.

During installation of the track roller it will be desirable to ensure that the cross drilled hole is positioned in the unloaded zone of the track roller raceway. The location of the cross-drilled hole can be best recognized by its alignment with the manufacturer's stamp or parallel to the screwdriver slot, in certain cases.

## LUBRICATION OF YOKE TYPE TRACK ROLLERS

Yoke type track rollers are produced with a lubricating hole in the inner ring so they can be relubricated through a cross-drilled hole in the supporting shaft or bolt. When mounting yoke type track rollers, care should be taken that the lubrication hole is located in the unloaded raceway zone.

Oil is the preferred lubricant for yoke type track rollers. Continuous oil lubrication or frequent grease lubrication should be used for steady rotating conditions. Applications involving slow, intermittent oscillations are not as critical, and longer intervals between relubrication are permitted. Sealed yoke type track rollers are normally supplied with an initial charge of a medium temperature grease. Caged yoke type track rollers have maximum grease storage capacity and, consequently, longer pregreased life than full complement types.

TABLE 7 – METRIC SERIES GREASE FITTINGS, SERIES VENN

# NEEDLE ROLLER BEARINGS

## STUD TYPE AND YOKE TYPE TRACK ROLLERS

### INCH SERIES

Inch series track rollers listed in this catalog have been designed with the outer rings of large radial cross section to withstand heavy rolling or shock loads on track type or cam-controlled equipment.

CR with Stud

YCR for Yoke Mounting

### REFERENCE STANDARD:

- **ANSI/ABMA Std. 18.2** – Needle roller bearings – radial, inch design.

Before selecting specific inch series track rollers, the engineering section of this catalog should be reviewed.

C

### IDENTIFICATION

The type, special construction features, and size are designated by an identification code consisting of prefix letters followed by a dash and suffix numbers.

The initial prefix letters denote the type of track roller/cam follower. Additional prefix letters are used when it is necessary to denote special construction features. The suffix numbers following the prefix letters denote the size of the track roller. See Table 1.

The basic types are listed below:

- CR - regular stud type, full complement needle rollers, inch series
- YCR - yoke type, full complement needle rollers, inch series

Construction feature code letters for inch series track rollers are used as required, in the following order:

- S - seals with internal thrust washers
- B - hexagonal wrench socket in stud head (stud type only)
- C - profiled outer ring
- E - eccentric stud (stud type only)

Descriptions of typical examples, with complete letter codes combining basic type of bearing and construction features follow. See Table 2.

Since the entire identification code might not appear on the bearing itself, the manufacturer's parts list or another reliable source should always be consulted when ordering bearings for field or service replacement, to make certain that the correct unit with the correct lubricant is specified.

TABLE 1 – IDENTIFICATION CODE – INCH SERIES

| Prefix Letters |      |                       | Suffix Numbers |           |        | Complete    |

### CONSTRUCTION

Timken products listed on the following pages have been designed with the outer ring of large radial cross section to withstand heavy rolling and shock loads on track type or cam-controlled equipment.

Regular stud type (CR) are designed with integral studs for cantilever mounting. When a regular stud type track roller is used within the permissible dynamic load ( $F_{r \text{ perm}}$ ) given in the tabular data, the ductile core of the stud provides the necessary toughness for and resistance to shock loads. A screwdriver slot or a hexagonal wrench socket in the head of the stud facilitates mounting.

Yoke type (YCR) are designed for straddle mounting. Each type is available with a full complement of needle rollers.

All inch series track roller have a black-oxide finish on all external surfaces.

### SEALED TRACK ROLLERS – INCH SERIES

Inch series sealed track rollers contain a lip type seal and an internal thrust washer. On some sizes of track rollers, the thrust washer and seal have been incorporated into a single component. Regardless of configuration, the thrust washer fits between the shoulders of the outer ring and inside faces of the steel retaining washer and flange of the stud. These washers reduce sliding friction and serve to increase the life of the bearing, particularly when it is infrequently relubricated or where misalignment occurs. In all cases, the external dimensions of the sealed bearings are the same as the unsealed bearings. The seals are thermally stable in a temperature range between  $-25^{\circ}\text{F}$  and  $+225^{\circ}\text{F}$ .

### PROFILED TRACK ROLLERS

These units are available with cylindrical or profiled outer rings.

Track rollers are designed with a profiled outer ring to alleviate the uneven bearing loading resulting from deflection, bending or misalignment in mounting.

To specify a profiled ring for any inch series track roller having a cylindrical outer ring, add the letter "C" at the end of the prefix code. For example:

- prefix CR – regular stud type, full complement of needle rollers and cylindrical outer ring
- prefix CRC – same as above, but with profiled outer ring.

The O.D. tolerance of profiled track rollers is  $+0.000 - 0.002$  inch. The profile radii are listed in Table 3.

TABLE 3 – PROFILE RADIUS FOR TYPES CRC, CRSC, CRSBC, YCRC, YCRSC

| -24                          | 20                                 |                              |                                    |
| -26                          | 20                                 |                              |                                    |

### HEXAGONAL SOCKETS

Smaller sizes of regular inch series stud type units have a screwdriver slot or a hexagonal socket in the flanged end of the stud to facilitate mounting. Larger sizes have a socket to accommodate a hexagonal wrench. Wrench sizes are listed in Table 4.

## NEEDLE ROLLER BEARINGS

### ECCENTRIC STUDS

To provide radial adjustment of the outer ring toward the track or cam surface at the time of installation, the regular inch series stud types are available with eccentric studs which are specified by adding the letter "E" to the construction feature code:

prefix CRSBE – regular stud type track roller with full complement of needle rollers, two seals, with internal thrust washers, hexagonal wrench socket in stud head, and eccentric stud.

Pertinent dimensions of the eccentric stud are listed in Table 5.

Since a track roller with an eccentric stud is usually adjusted upon installation by turning the stud in the mounting hole, a close clearance fit between the outside diameter of the bushing and the mounting hole is necessary. For turning the stud, a hexagonal wrench is generally more convenient than a screwdriver, and an option for a hexagonal wrench socket in the head of the stud should be exercised.

Some applications may require more secure positioning than provided by the tightened stud nut. If so, it is suggested that the housing and eccentric bushing be drilled at the time of installation to accept a locating dowel pin.

TABLE 4 – HEXAGONAL WRENCH SIZES – INCH SERIES

| Size Designation (suffix) | Wrench Size Inch | Size Designation (suffix) | Wrench Size Inch |

| -56                       | 1.812                                  | 1.375                            | 0.060        |
| -64                       | 2.000                                  | 2.000                            | 0.060        |

\* To ensure proper clamping of the stud, the housing should be slightly wider than the maximum width of the eccentric bushing.

### LOAD RATINGS

#### DYNAMIC LOADING AS A TRACK ROLLER

When the outer ring of a stud type or yoke type track roller runs on a track, the contact under a radial load causes elastic (oval) deformation of the outer ring. As a result, a smaller zone of the raceway is loaded and the load is distributed on fewer needle rollers. This in turn affects the track roller's dynamic and static load ratings. Also, this deformation generates bending stress in the outer ring which must not exceed the maximum permitted for the material of the outer ring. The maximum permissible dynamic ( $F_{rperm}$ ) radial load condition is determined by this requirement.

The rating life of a stud type or yoke type track roller should be calculated using the dynamic load ratings  $C_w$  shown in the tables. The tables also show the maximum permissible radial load,  $F_{rperm}$  that can be dynamically applied on the stud type or yoke type track rollers. However, to calculate the  $L_{10}$  life of a track roller, the applied radial load must not be greater than  $C_w/4$  based on ideal operating conditions of alignment, lubrication, temperature, speed and accelerations.

**STATIC LOADING**

In addition to the basic static load rating  $C_0$ , the tables also list the maximum permissible static radial load  $F_{0r\ perm}$  that may be applied to a stud type or yoke type track roller. The values of  $F_{0r\ perm}$  result in a minimum static factor  $f_s$  of 0.7 for the worst condition of internal load distribution in inch series track roller operation. The  $F_{0r\ perm}$  values must not be exceeded. The static factor  $f_s$  can be calculated using the following formula:

$$f_s \geq 0.7 \cdot \frac{F_{0r\ perm}}{P_{0r}}$$

where

$F_{0r\ perm}$  = Maximum permissible static radial load

$P_{0r}$  = Equivalent static load

$P_{0r} = F_{0r}$  for yoke type track rollers

$F_{0r}$  = Static radial load

$f_s$  = Static factor whose values should not be smaller than those suggested in table 6

**TABLE 6 – SUGGESTED VALUES FOR STATIC FACTORS  $f_s$  FOR INCH SERIES TRACK ROLLERS**

| Requirements For Yoke Type Track Rollers And Stud Type Track Rollers         | Suggested $f_s$ Values |
|------------------------------------------------------------------------------|------------------------|
| High shock-type loads                                                        |                        |
| Quiet running                                                                | 1.5...2.5              |
| Normal loading                                                               |                        |
| Normal quietness of running                                                  | 1...1.5                |
| Minor impact loads and rotary motion particularly quiet running not required | 0.7...1                |

**MOUNTING**

The surface of the hole in the machine element, which supports the stud or the mounting shaft, must not deform under the expected load, and the support should be sufficiently rigid to resist bending loads.

Deformation and bending will cause uneven loading of the outer ring.

In mounting the stud type track roller, the retaining washer must be firmly backed up by a flat shoulder which is square with the stud center line. The shoulder diameter must be no smaller than the minimum clamping diameter ( $d_a$ ) listed in the tabular data.

The maximum inherent strength of the stud is obtained when the unit is supported as close as possible to the retaining washer, which minimizes the bending moment. For this reason, the edge of the housing which supports the stud shank should be kept as sharp as possible, but free from burrs.

To minimize deflection in mounted stud type track rollers, the stud shank should be housed with the fit ( $d_b$ ) shown in the tabular data. The clamping nut should not be tightened with a torque value higher than the maximum listed. A screwdriver slot or hexagonal socket in the end of the stud is provided for a tool to prevent the stud from turning when the nut is being tightened. Since the bottom of the screwdriver slot is not flat, it is helpful to put a radius on the tip of the screwdriver being used to hold the stud more securely.

When the stud shank is housed with an interference fit, installation force should be applied only to the center portion of the flanged end of the stud, preferably with an arbor press.

When the loads are high, the yoke type track rollers should be mounted on a high strength bolt or shaft with the tight transition fit listed in the tabular data. The bearing should be clamped between flat and parallel faces at right angles to the axis to prevent the retaining washers from coming off under load. If the bearing cannot be clamped, a close axial fit in the yoke is required.

When the applied loads are light to moderate, the inner ring of a yoke type track roller may be mounted on an unhardened shaft or bolt with the loose transition fit listed in the tabular data. Again, the retaining washers should be backed up axially to prevent their coming off under load.

## NEEDLE ROLLER BEARINGS

### LUBRICATION

All inch series stud type track rollers with a screwdriver slot in the flanged end of the stud have provisions for lubrication through the flanged end of the stud. The 12 and larger sizes of inch series stud type track rollers with screwdriver slots have provisions for relubrication through either end of the stud and through a cross-drilled hole in the shank. The ends of the axial holes are counterbored to accept drive type grease lubrication fittings. Hole diameters for these grease fittings are listed in the tables of dimensions.

Sizes 8 through 10-1 of the inch series stud type track rollers with a hexagonal socket in the flanged end of the stud cannot be relubricated. Size 12 and up have relubrication provisions in the threaded end of the stud and a cross-drilled hole in the shank. At the threaded end of the stud, the axial hole is counterbored to receive a drive type grease fitting. Sizes 12 through 22 and 48 through 64 of inch series stud type track rollers with hexagonal sockets also have provisions for relubrication through the hex socket in the flanged end of the stud. Sizes 48 through 64 are supplied with lubrication fittings which may be installed in the axial hole in the bottom of the hexagonal slot in the head end of the stud, at a depth which allows the hexagonal wrench to be inserted in the wrench socket without damaging the grease fitting.

Plugs are furnished with stud type track rollers to close off unused holes. If the cross-drilled hole in the stud shank is not used, it will be covered when the track roller is installed properly.

Most inch series yoke type track rollers are produced with lubrication holes and grooves in the inner ring bores so they can be relubricated through axially and radially drilled holes in the supporting shaft or bolt.

Oil is the preferred lubricant for all types. Use continuous oil lubrication or frequent grease lubrication for steady rotating conditions. Applications involving slow, intermittent oscillation are not as critical, and longer intervals between relubrication are permissible. Both stud and yoke type track rollers are normally supplied with medium temperature grease lubrication.

### SPECIAL TRACK ROLLERS/ CAM FOLLOWERS

Track rollers can be obtained with dimensions different from those in the tabular data, if the quantities permit economical production. For these and other modifications please consult your Timken representative.

C

### FORKLIFT TRUCK

Yoke type sealed units serve as high capacity and rugged guide rollers for lift trucks. Their design permits them to be mounted on studs welded to the structure. The seals exclude foreign matter and extend the time between relubrication periods.

### HAY BALER

Stud types are important components on many different types of farm equipment because of their required long service life under punishing loads and severe operating conditions. Needle bearings provide dependable and economical operation in the windrow pickup of hay balers.

### MACHINE WAY

Heavily loaded machine tool tables must travel freely and accurately. Stud and yoke type sealed units, in combination, support and guide such tables under the most severe conditions. The high capacity and the very low wear rate permit heavy loads to be carried without impairing the accuracy of the table's travel. The seals exclude dirt and chips and make the need for relubrication infrequent.

### RECIPROCATING SLIDE

Stud types find wide application in feeding and advancing mechanisms on metalworking presses. The rotary motion of an eccentric cam rotating between two cam followers mounted on a slide imparts reciprocating linear motion to the slide. Dwell periods as well as accuracy in both rapid and slow linear actuation of the slide are made possible.

# NEEDLE ROLLER BEARINGS

## STUD TYPE TRACK ROLLERS CR, CRS SERIES

### INCH SERIES

- Screwdriver slot in head facilitates mounting.
- Nonseparable, sealed unit with outer ring, full complement of needle rollers, stud seals, self-lubricating resin internal thrust washers, and stud-fastened retaining washer.
- Seals help retain lubricant and exclude foreign matter (CRS Series).
- Relubrication via axially drilled hole through stud with cross-drilled holes in stud raceway and shank.
- Recessed axial hole accepts standard nominal inch drive-type grease lubrication fitting.
- Lubrication fitting plugs furnished to close off unused holes.
- Tolerance limits for outside diameters of stud and outer ring refer to "single mean diameter" (see engineering section).
- A close fit between stud and hole required for mounting.
- Bore dimensions given below result in varying fit (0.0010 in. tight to 0.0005 in. loose).
- Retaining washer should be firmly backed up by flat housing shoulder (perpendicular to the stud axis).
- Shoulder diameter should be at least same size as minimum clamping diameter listed.
- May be mounted with two thin lock nuts or nut and lock washer.

| Outside Diameter | Dimensions mm/in.  |                   |                   |                |                |                |                                 |                |         |     | Track Roller Designation |                                        |

## Stud Type and Yoke Type Track Rollers

CR and CRS -12 to -64

CR and CRS -8 to -10-1

Note: Clamping torque is based on lubricated threads. If threads are dry, the torque values listed below may be doubled.

# NEEDLE ROLLER BEARINGS

## STUD TYPE TRACK ROLLERS

### CR, CRS SERIES – *continued*

#### INCH SERIES

- Screwdriver slot in head facilitates mounting.
- Nonseparable, sealed unit with outer ring, full complement of needle rollers, stud seals, self-lubricating resin internal thrust washers, and stud-fastened retaining washer.
- Seals help retain lubricant and exclude foreign matter (CRS Series).
- Relubrication via axially drilled hole through stud with cross-drilled holes in stud raceway and shank.
- Recessed axial hole accepts standard nominal inch drive-type grease lubrication fitting.
- Lubrication fitting plugs furnished to close off unused holes.
- Tolerance limits for outside diameters of stud and outer ring refer to “single mean diameter” (see engineering section).
- A close fit between stud and hole required for mounting.
- Bore dimensions given below result in varying fit (0.0010 in. tight to 0.0005 in. loose).
- Retaining washer should be firmly backed up by flat housing shoulder (perpendicular to the stud axis).
- Shoulder diameter should be at least same size as minimum clamping diameter listed.
- May be mounted with two thin lock nuts or nut and lock washer.

| Outside Diameter | Dimensions mm/in.                 |                                  |                                 |                |                |                |                |                                 |                | Track Roller Designation |                                        |        |

# NEEDLE ROLLER BEARINGS

## STUD TYPE TRACK ROLLERS CRSB SERIES

### INCH SERIES

- Nonseparable, sealed unit with outer ring, full complement of needle rollers, stud seals, self-lubricating resin internal thrust washers, and stud-fastened retaining washer.
- Seals help retain lubricant and exclude foreign matter (CRS Series).
- Hexagonal wrench socket in stud head for mounting
- Relubrication via axially drilled hole through stud with cross-drilled holes in stud raceway and shank.
- Recessed axial hole accepts standard nominal inch drive-type grease lubrication fitting.
- Lubrication fitting plugs furnished to close off unused holes.
- Tolerance limits for outside diameters of stud and outer ring refer to "single mean diameter" (see engineering section).
- A close fit between stud and hole required for mounting.
- Bore dimensions given below result in varying fit (0.0010 in. tight to 0.0005 in. loose).
- Retaining washer should be firmly backed up by flat housing shoulder (perpendicular to the stud axis).
- Shoulder diameter should be at least same size as minimum clamping diameter listed.
- May be mounted with two thin lock nuts or nut and lock washer.

| Outside Diameter | Dimensions mm/in.                 |                                  |                                 |                |                |                |                |                |                |         | Bearing Designation |

## NEEDLE ROLLER BEARINGS

### STUD TYPE TRACK ROLLERS

#### CRSB SERIES — *continued*

##### INCH SERIES

- Nonseparable, sealed unit with outer ring, full complement of needle rollers, stud seals, self-lubricating resin internal thrust washers, and stud-fastened retaining washer.
- Seals help retain lubricant and exclude foreign matter (CRS Series).
- Hexagonal wrench socket in stud head for mounting
- Relubrication via axially drilled hole through stud with cross-drilled holes in stud raceway and shank.
- Recessed axial hole accepts standard nominal inch drive-type grease lubrication fitting.
- Lubrication fitting plugs furnished to close off unused holes.
- Tolerance limits for outside diameters of stud and outer ring refer to “single mean diameter” (see engineering section).
- A close fit between stud and hole required for mounting.
- Bore dimensions given below result in varying fit (0.0010 in. tight to 0.0005 in. loose).
- Retaining washer should be firmly backed up by flat housing shoulder (perpendicular to the stud axis).
- Shoulder diameter should be at least same size as minimum clamping diameter listed.
- May be mounted with two thin lock nuts or nut and lock washer.

| Outside Diameter | Dimensions mm/in.                 |                                  |                                 |                |                |                |                |                |                |          | Bearing Designation |

# NEEDLE ROLLER BEARINGS

## YOKE TYPE TRACK ROLLERS YCR, YCRS SERIES

### INCH SERIES

- Non-separable unit with outer ring, a full complement of needle rollers, inner ring, self-lubricating resin internal thrust washers, and two retaining washers securely fastened to the inner ring.
- Seals in counterbores of outer ring seal against the retaining washers; retain lubricant and exclude foreign matter (YCRS Series).
- Dimensions shown are for unplated finished unit.
- Tolerance limits for outside diameters of stud and outer ring refer to "single mean diameter" (see engineering section).
- A close fit between stud and hole required for mounting bore dimensions given below result in varying fit (0.0010" tight to 0.0005" loose).
- Machine element must be sufficiently rigid in area of mounting bolt holes to resist local crushing under the applied load and resist bending causing uneven loading of rollers.
- Unit should be clamped endwise between parallel faces (perpendicular to axis) to prevent retaining washers from coming off under load.
- If the unit cannot be clamped, yoke requires a close axial fit.

## **NEEDLE ROLLER BEARINGS**

### **NOTES**

C

## THRUST BEARINGS, ASSEMBLIES, WASHERS

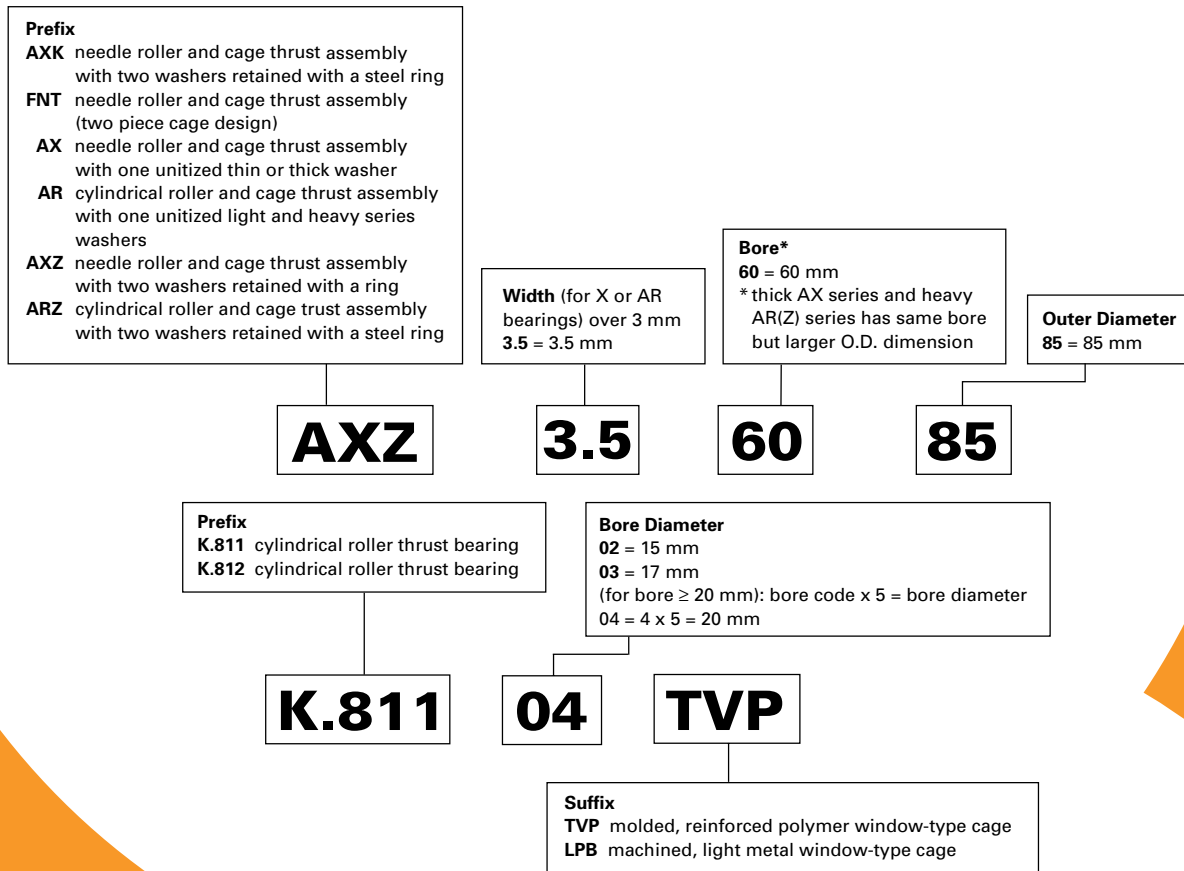

**Overview:** Needle roller and cage thrust assemblies are complements of small diameter needle rollers arranged in a spoke-like configuration. Needle rollers are equally spaced by means of a cage whose web section separates the rollers and provides guidance to keep them tracking in an orbital path. The purpose of these assemblies is to transmit a thrust load between two relatively rotating objects while greatly reducing friction.

Needle roller and cage thrust assemblies can also be unitized with lipped washers which service as raceway surfaces for the needle rollers. Washers can be supplied separately or can be mechanically unitized to the needle roller thrust assemblies for ease of handling.

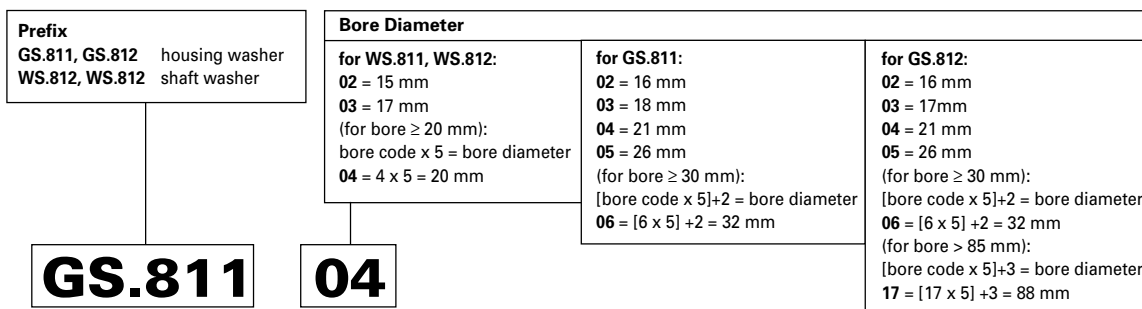

- **Sizes:** 6 mm - 140 mm (0.2362 in. - 5.5118 in.).
- **Markets:** Automotive automatic and manual transmissions, automotive accessories (compressors, steering gears, etc.) agricultural and construction equipment.
- **Features:** One-way fool-proof assembly features, anti-rotation locking features and lubrication flow enhancements.
- **Benefits:** High-speed performance and application flexibility.

## NEEDLE ROLLER BEARINGS

### NEEDLE ROLLER AND CAGE THRUST ASSEMBLIES AND THRUST WASHERS –

#### METRIC SERIES

Needle roller and cage thrust assemblies are available in a variety of sizes. They all have very small cross-sections. This catalog includes the most popular, standardized and non-standard designs. If back up surface cannot be used as a raceway, hardened washers are available.

#### REFERENCE STANDARDS ARE:

- **ISO 3031** – Rolling bearings – Needle roller and cage thrust assemblies, thrust washers – Dimensions and tolerances
- **DIN 5405 Part 2** – Rolling bearings – Needle bearings – Thrust needle roller and cage assemblies.
- **DIN 5405 Part 3** – Rolling bearings – Needle bearings – Thrust washers
- **ANSI/ABMA Std. 21.1-1988** – Thrust needle roller and cage assemblies and thrust washers – Metric design.

Before selecting specific needle roller and cage thrust assemblies, the engineering section of this catalog should be reviewed.

#### TYPES OF METRIC SERIES NEEDLE ROLLER AND CAGE THRUST ASSEMBLIES AND THRUST WASHERS

**AXK, FNT**  
Needle roller & cage thrust assembly

**LS**  
Heavy thrust washer

**AS**  
Thin thrust washer

**FNTKF (FNTK, FNTF)**  
Unitized thrust bearing assembly

**WS.811**  
Shaft piloted washer

**GS.811**  
Housing piloted washer

### CONSTRUCTION

#### NEEDLE ROLLER AND CAGE THRUST ASSEMBLIES

The needle roller and cage thrust assembly (Series FNT) has a two piece steel cage and through hardened needle rollers which are precision finished to close tolerances for optimum load distribution. The cage is comprised of two mating pieces that are securely fastened together.

Series AXK needle roller and cage thrust assembly, which can be used interchangeably with the FNT assembly, has a one piece cage. The cage is similar in design to the successful profiled radial steel cages.

These cage assemblies have a very thin section and when they must run directly against the back up surface raceways their section may be 2 to 5 mm (0.08 to 0.20 in.) which is equivalent to the diameter of the needle rollers used.

When the back up surfaces cannot be hardened and ground, hardened washers of different thicknesses are available.

#### UNITIZED THRUST BEARING ASSEMBLIES

Thrust bearing assemblies of the FNTK, FNTF and FNTKF Series have been specially designed for use in applications where a unitized assembly allows for ease of installation and eliminates the need for heat treatment and precision finishing of one or both thrust bearing backup surfaces.

Each FNTK, FNTF or FNTKF assembly consists of a FNT needle roller and cage thrust assembly with one or two special lipped washers that snap over the cage to produce a unitized thrust bearing assembly. The FNTK and FNTF assembly has one such washer, the FNTKF assembly has a washer on each side of the bearing.

The backup surfaces for these unitized thrust bearing assemblies should meet the limits of permissible out-of-squareness and coning or dishing as shown in figures 1 and 2 on C232. Oil is the preferred lubricant for these assemblies, however they are also available pregreased for applications that do not allow for oil lubrication.

The rolling elements of the AX Series thrust bearings are retained and guided in radial pockets within the cage. The cage is retained in relation to the thrust washer by means of a retaining cap. The design of a one-piece steel cage employs a special curvature that guides the rolling elements by their ends along their centerlines.

In addition, this special curvature gives the steel cage great rigidity while providing maximum lubricant space. This unitized assembly of components facilitates installation and provides a high axial load capacity while occupying only minimal space. Note that the AX Series is not interchangeable with the AXK Series or FNT Series needle roller and cage thrust assemblies.

Standard AX Series needle thrust bearings combined with a thick washer provide rotational accuracy and axial run-out to Class 6 levels according to ISO Standard 199 for ball thrust bearings. They can be supplied in High Precision "HP" quality, providing a precision grade above Class 5. AX Series needle thrust bearings with a thin washer are of minimal thickness and provide excellent economy. They should be considered whenever the degree of support and rotational accuracy requirement allow.

### THRUST WASHERS

Ideally, a thrust washer should be stationary with respect to, and piloted by, its supporting or backing member, whether or not this is an integral part of the shaft or housing. There should be no rubbing action between the thrust washer and any other machine member. Some thrust washers are designed for bore piloting others may be piloted by their outside diameter.

### THIN THRUST WASHERS (AS)

The metric series thin thrust washers are made of hardened spring steel. They may be out of flat due to heat treatment, but will flatten under load. Thin washers are used when the supporting or backing members cannot be adequately prepared as raceways for the needle rollers. These washers are only 1 mm (0.04 in.) thick (dimensions) and provide a very compact and cost-effective bearing arrangement. Although they are usually guided on the shaft, they may be housing-guided when required by application.

### HEAVY THRUST WASHERS (LS)

These metric series thrust washers are made of bearing quality steel, hardened and precision ground on the flat raceway surfaces. Their bores and outside diameters are not ground but provide satisfactory surfaces for shaft piloting or housing piloting arrangements.

### SHAFT PILOTED WASHERS (WS.811) AND HOUSING PILOTED WASHERS (GS.811)

These shaft piloted and housing piloted metric series thrust washers are primarily for use with metric series cylindrical roller thrust bearings of Series 811. They are made of bearing quality steel with, hardened and precision ground and lapped flat raceway surfaces. The tolerances of the thrust bearing bore and outside diameter shown in the engineering section apply to shaft and housing piloted washers.

### THIN (CP) AND THICK (CPR) THRUST WASHERS

The washer incorporated in the AX Series thrust bearing is made from hardened bearing steel and forms one of the raceways for the rolling elements. The opposing raceway is generally provided by a separate thrust washer of similar design supplied by Timken. When the AX Series thrust bearing is piloted by the revolving part, the thrust washer must be piloted by the stationary part and vice versa. If the revolving part and the stationary part are noticeably eccentric to each other, the thrust bearing with integral washer must, without exception, be piloted by the revolving part.

The second raceway for the rolling elements may also be formed by the face of a shoulder or an inserted washer, provided these have the correct hardness and geometric dimensions.

## DIMENSIONAL ACCURACY

### TOLERANCES FOR NEEDLE ROLLER AND CAGE THRUST ASSEMBLIES

Pages C234 to C237 list the nominal outside diameter, bore diameter and needle roller diameter for the FNT and AXK Series of needle roller and cage thrust assemblies and also the nominal outside diameter and bore diameter of the series AS, LS, WS and GS thrust washers. Thickness tolerances for the AS and LS thrust washers are also included.

Tolerances for the outside and bore diameters of series FNT and AXK needle roller and cage thrust assemblies are given in Table 1. The needle rollers in any one assembly have a group tolerance of 2  $\mu\text{m}$  (80  $\mu\text{in.}$ ).

**TABLE 1 – TOLERANCES FOR OUTSIDE DIAMETER ( $D_c$ ) AND BORE DIAMETER ( $D_{c1}$ ) OF SERIES FNT AND AXK NEEDLE ROLLER AND CAGE THRUST ASSEMBLIES**

### BORE INSPECTION PROCEDURE FOR ASSEMBLY

If an inspection of the bore diameter is desired, the bore diameter ( $D_{c1}$ ) of the assembly should be checked with "go" and "no go" plug gages. The "go" plug gage size is the minimum bore diameter of the assembly. The "no go" plug gage size is the maximum bore diameter of the assembly.

The assembly, under its own weight, must fall freely from the "go" plug gage. The "no go" plug gage must not enter the bore. Where the "no go" plug gage can be forced through the bore, the assembly must not fall from the gage under its own weight.

### TOLERANCES FOR THRUST WASHERS

Tolerances for the bore diameters of series WS, shaft piloted thrust washers are given in the engineering section. Tolerances for the outside diameters of Series GS, housing piloted thrust washers are given in the engineering section.

Tolerances for the outside and bore diameters of Series AS thrust washers are given in Table 2. Thickness tolerance for Series AS thrust washers is  $\pm 0.05$  mm ( $\pm 0.002$  in.).

### BORE INSPECTION PROCEDURE FOR SERIES AS AND LS THRUST WASHERS

If an inspection of the thrust washer bore diameter ( $d$ ) is desired, it should be checked with "go" and "no go" plug gages. The "go" plug gage size is the minimum bore diameter of the thrust washer. The "no go" plug gage size is the maximum bore diameter of the thrust washer.

The thrust washer, under its own weight, must fall freely from the "go" plug gage. The "no go" plug gage must not enter the bore. Where the "no go" plug gage can be forced through the bore, the thrust washer must not fall from the gage under its own weight.

## MOUNTING TOLERANCES

### NEEDLE ROLLER AND CAGE THRUST ASSEMBLIES – METRIC SERIES

On FNT and AXK Series needle roller and cage thrust assemblies, the cage bore has a closer tolerance than the outside diameter, therefore bore piloting is preferred for these assemblies. To reduce wear it is suggested that the piloting surface for the cage be hardened to an equivalent of at least 55 HRC. Where design requirements prevent bore piloting, the FNT or AXK Series needle roller and cage thrust assemblies may be piloted on the outside diameters. For such cases, suitable O.D. piloting dimensions should be determined. Mounting tolerances are given in Table 4.

### THRUST WASHERS

The mounting tolerances for series AS, LS, WS and GS thrust washers for use with needle roller and cage thrust assemblies are given in Table 4.

As for the FNT and AXK Series thrust assemblies, to reduce wear, the piloting surface for the thrust washers should also be hardened to an equivalent of at least 55 HRC.

### BACK UP SURFACES

In some applications, it is desirable to use the back up surfaces as raceways for the needle rollers of the needle roller and cage thrust assemblies. In such designs these surfaces should be parallel and must be hardened to at least 58 HRC. If this hardness cannot be achieved, and thrust washers cannot be used, the load ratings must be reduced, as explained in the engineering section.

Thrust raceway surfaces must be ground to a surface finish of  $0.2 \mu\text{m } R_a$  ( $79 \mu\text{in } R_a$ ). When this requirement cannot be met, thrust washers must be used.

The raceways against which the needle rollers operate, or the surface against which the thrust washers bear must be square with the axis of the shaft. Equally important, the raceway, or surface backing the thrust washer, must not be dished or coned. The permissible limits of out-of-squareness and dishing or coning are shown in Figures 1 and 2.

Raceway contact dimensions  $E_a$  and  $E_b$  are given in the tabular pages. For the thin series AS thrust washers, full back up between the dimensions  $E_a$  and  $E_b$  should be provided.

For AX Series thrust bearings, the maximum out of square must be of no more than 0.0005 mm (maximum angle no more than 1 min. 43 sec.), see Figure 1.

Thin series needle thrust bearings and thin thrust washers must be supported on a flat, rigid, and continuous face throughout the area of circulation of the needles bounded by dimensions  $E_b$  and  $E_a$ .

Thick series needle thrust bearings and thick thrust washers can be supported on a more restricted or discontinuous shoulder, provided that the deflection of the washer under load does not impede the smooth operation of the thrust bearing or the required axial run-out.

When an application does not involve the use of a thrust washer, the surface forming the second raceway must:

- extend at least across the whole area of circulation of the rolling elements between dimensions  $E_b$  and  $E_a$ , and,
- possess a suitable surface finish ( $\leq 0.2 \mu\text{m } R_a$  or  $\leq 79 \mu\text{in } R_a$ ) and sufficient hardness in relation to the load to be supported. A hardness of 58 HRC (min.) enables thrust bearings to carry their full load capacity. Lower hardness values reduce the capacities shown in the tables of dimensions (see tabulated sizes).

### TOLERANCES FOR PILOTING SURFACES (AX SERIES)

- Piloting on the shaft : h10 on dimensions  $D_{c1}$  for thrust bearings or dimension  $d$  for thrust washers.
- Piloting in the housing : H10 on dimensions  $D$  for thrust bearings or dimension  $d_1$  for thrust washers.

## LOAD RATINGS

### MINIMUM AXIAL LOAD

Slippage can occur if the applied axial load is too light and the operating speed of the needle roller and cage thrust assembly is high, particularly if accompanied by inadequate lubrication. For satisfactory operation, a certain minimum load must be applied to a needle roller and cage thrust assembly which can be calculated from:

$$F_{a \text{ min}} = C_0/2200 \text{ [kN]}$$

where

$C_0$  - static load rating [kN]  
 $F_{a \text{ min}}$  - minimum axial load [kN]

### COEFFICIENT OF FRICTION

In general, the coefficient of friction of a thrust bearing (consisting of a needle roller and cage thrust assembly and thrust washers) is defined as the friction torque divided by the product of the applied load and the bearing pitch radius. This coefficient of friction is not a constant value but will vary considerably with load, speed and lubricant. Generally the coefficient of friction becomes smaller as the load is increased and larger as the speed is increased. It is suggested that a value of 0.003 to 0.004 be used for needle thrust bearings and 0.004 to 0.005 be used for roller thrust bearings as a conservative estimate.

### LUBRICATION

Oil is the preferred lubricant for needle roller and cage thrust assemblies and an ample oil flow is absolutely necessary for high speeds, or for moderate speeds when the load is relatively high.

When the application must utilize grease lubrication the needle roller and cage thrust assembly should be ordered pregreased. When the speeds are low, and rotation is not continuous, the initial charge of grease may be suitable for the life of the application. When the speeds are moderate, however, the designer must provide for frequent regreasing. Since the needle rollers tend to expel the lubricant radially outward, relubrication passages should be directed to the bore of the cage whether oil or grease is used as the lubricant.

### SPECIAL DESIGNS

Needle roller and cage thrust assemblies and thrust washers are also made to special dimensions and configurations, as well as from special materials, when quantities permit economical manufacture.

Needle roller and cage thrust assemblies are particularly adaptable to low cost integral combination with special thrust washers. When the use of such special designs is considered, the following pages should be reviewed for evaluation of proposed arrangements.

### TYPE AXJ BEARINGS

Needle thrust bearings type AXJ have been developed by Timken to run at very high rotational speed. They comprise two rows of needles retained and guided in hardened steel cages. These assemblies are retained on either side of a common washer by inserted retaining caps which serve to center them with adequate clearance in relation to the washer.

The special feature of these thrust bearings is the self-piloting action to which each rotating ring of needles is submitted. This self-piloting is transmitted to the washer which is "floating" in relation to the shaft. For this reason, the relative speed of each ring of needles relative to its raceway and the speed of the washer relative to the rotating shaft are reduced by about half.

With a well-designed oil circulation, type AXJ thrust bearings permit speeds approximately twice that achieved with normal thrust bearings.

To ensure the axial position of a shaft in both directions, two AXJ thrust bearings should be mounted on either side of an intermediate washer with oil hole (type PMH), piloted in the housing. Please consult your Timken representative for applications involving the use of these special thrust bearings.

**NEEDLE ROLLER AND CAGE THRUST ASSEMBLIES, THRUST WASHERS**

**METRIC SERIES**

- Dimensions for bore and O.D. of thrust assemblies and washers are nominal.
- See page C232 for details on piloting and backup surfaces.
- Thrust washers burnished at least one-quarter of bore area (remainder is rough breakaway finish).
- O.D. finish of washers will be as blanked.
- Thinner washers may be out of flat due to distortion in hardening in the free state (expected to flatten out under load).

**NEEDLE ROLLER AND CAGE THRUST ASSEMBLIES, THRUST WASHERS - continued**

**METRIC SERIES**

- Dimensions for bore and O.D. of thrust assemblies and washers are nominal.
- See page C232 for details on piloting and backup surfaces.
- Thrust washers burnished at least one-quarter of bore area (remainder is rough breakaway finish).
- O.D. finish of washers will be as blanked.
- Thinner washers may be out of flat due to distortion in hardening in the free state (expected to flatten out under load).

FNT, AXK

**UNITIZED THRUST BEARING TYPE FNTKF**

**METRIC SERIES**

- Combines low friction and thin cross-section with the convenience of complete packaged assembly.
- Used where both thrust backup surfaces are not suitably hardened or ground.
- Backup surfaces should meet limits of permissible out-of-squareness, dishing or coning (see Figures 1 and 2 on page C232).
- Assembly can be either shaft or housing piloted, but not both (see mounting dimensions shown on the opposite page).
- Many special sizes available – contact your Timken representative.
- Call for availability.

\* To be measured under a 1.5 kN (0.34 lb.) load.

## UNITIZED THRUST BEARING TYPE FNTK

### METRIC SERIES

- Combine low friction and thin cross-section with the convenience of complete packaged assembly.
- Integral washer allows use where one thrust backup surfaces is not suitably hardened or ground.
- Backup surface should meet limits of permissible out-of-squareness, dishing or coning (see Figures 1 and 2 on page C232).
- Backup surface finish of 0.2  $\mu\text{m}$   $R_a$  (min.) or 8.0  $\mu\text{m}$   $R_a$  (min.) required.
- Assembly can be either shaft or housing piloted, but not both (see mounting dimensions shown on the opposite page).
- Many special sizes available – contact your Timken representative.
- Call for availability.

# NEEDLE ROLLER BEARINGS

## CYLINDRICAL ROLLER THRUST BEARINGS AND THEIR COMPONENTS

### METRIC SERIES

Cylindrical roller thrust bearings provide rolling bearing arrangements which can accommodate high dynamic axial loads as well as shock loads. The simple geometry of the bearing components allows the use of many design arrangements. As an example, for less demanding applications it is possible to combine metric series cylindrical roller and cage thrust assemblies with the metric series heavy thrust washers (LS,CPR) and even metric series thin thrust washers (AS, CP). These two thrust washer types are more commonly used with needle roller and cage thrust assemblies. Cylindrical roller and cage thrust assemblies can also be used without bearing thrust washers if the adjacent machine components can be prepared to serve as suitable raceways.

Cylindrical roller thrust bearings may be used where the load carrying capability of needle roller and cage thrust assemblies is insufficient. Also the bearings can accommodate high dynamic and static axial loads in one direction but they are not suitable to transmit radial loads.

### REFERENCE STANDARDS ARE:

- **ISO 104** – Rolling bearings – Thrust Bearings – Boundary dimensions, general plan.
- **ISO 199** – Rolling bearings – Thrust ball bearings – Tolerances.
- **DIN 616** – Rolling bearings – General Plans of Boundary Dimensions
- **DIN 722** – Single direction thrust cylindrical roller bearings

### TYPES OF METRIC SERIES CYLINDRICAL ROLLER THRUST BEARINGS AND THEIR COMPONENTS.

**811, 812 Series**  
Cylindrical roller thrust bearings

**K.811, K.812**  
Cylindrical roller and cage thrust assemblies

**ARZ Series**  
Unitized cylindrical roller thrust bearing

**WS.811, WS.812**  
Shaft washers

**GS.811, GS.812**  
Housing washers

### Suffixes

| <b>LPB</b> | machined light metal window type cage.             |
| <b>TVP</b> | molded window type cage of glass reinforced nylon. |

## CONSTRUCTION

### BASIC DESIGNS

Cylindrical roller thrust bearings of dimension Series 811 and 812 comprise of a cylindrical roller and cage thrust assembly (K), a shaft washer (WS) and a housing washer (GS). Providing the back up surfaces can be hardened and ground they can be used as raceways for the cylindrical rollers of the cylindrical roller and cage thrust assembly, resulting in a compact bearing arrangement.

Series AR are available with thin or thick CP washers or heavy CPR thrust washers.

### THRUST BEARINGS WITH TWO THRUST WASHERS

Thrust bearing type AXZ and ARZ each have two thrust washers retained by an integral cap, giving protection against the entry of dirt and metal particles while helping to retain the lubricant.

### CAGE DESIGNS

Metric series 811 and 812 cylindrical roller thrust bearings use molded cages of glass fiber reinforced nylon 6/6 (suffix TVP), or machined cages of light metal (suffix LPB). The cages are designed to be piloted on the shaft. The reinforced nylon cages can be used at temperatures up to 120° C (250° F) continuously for extended periods. When lubricating these bearings with oil it should be ensured that the oil does not contain additives detrimental to the cage over extended life at operating temperatures higher than 100° C (212° F). Also, care should be exercised that oil change intervals are observed as old oil may reduce cage life at such temperatures.

The rolling elements of the AR Series thrust bearings are retained and guided in radial pockets within the cage. The cage is retained in relation to the thrust washer by means of a retaining cap. The design of a one-piece steel cage employs a special curvature that guides the rolling elements by their ends along their centerlines.

In addition, this special curvature gives the steel cage great rigidity while providing maximum lubricant space. This unitized assembly of components facilitates installation and provides a high axial load capacity while occupying only minimal space.

AR Series needle thrust bearings with a thin washer are of minimal thickness and provide excellent economy. They should be considered whenever the degree of support and rotational accuracy requirement allow.

## BEARING THRUST WASHERS

### SHAFT WASHERS AND HOUSING WASHERS

Shaft washers of types WS.811 and WS.812 as well as housing washers of types GS.811 and GS.812 are components of the metric series cylindrical roller thrust bearings of series 811 and 812. They are made of bearing quality steel, with hardened and precision ground and lapped flat raceway surfaces. The tolerances of the thrust bearing bore and outside diameter shown in the engineering section apply to shaft and housing piloted metric series washers.

### HEAVY THRUST WASHERS (LS), THIN THRUST WASHERS (AS)

These thrust washers, more frequently used with needle roller and cage thrust assemblies of metric series FNT or AXK, are also suitable for use with the cylindrical roller and cage thrust assemblies K.811. The heavy thrust washer of series LS are made of bearing quality steel, hardened and precision ground on the flat raceway surfaces. The bore and outside diameters of the heavy thrust washers are not ground, therefore, when used with K.811 type assemblies they are only suggested where accurate centering is not required. The thin thrust washers of series AS may be used in applications where the loads are light. Both types of these washers are listed in the tabular part of the metric series needle roller and cage thrust assemblies section.

### THIN (CP) AND THICK (CPR) THRUST WASHERS

The washer incorporated in the AR Series thrust bearing is made from hardened bearing steel and forms one of the raceways for the rolling elements. The opposing raceway is generally provided by a separate thrust washer of similar design supplied by Timken. When the AR Series thrust bearing is piloted by the revolving part, the thrust washer must be piloted by the stationary part and vice versa. If the revolving part and the stationary part are noticeably eccentric to each other, the thrust bearing with integral washer must, without exception, be piloted by the revolving part.

The second raceway for the rolling elements may also be formed by the face of a shoulder or an inserted washer, provided these have the correct hardness and geometrical dimensions.

C

**DIMENSIONAL ACCURACY**

The tolerances for the metric series cylindrical roller thrust bearing bore and outside diameter shown in the engineering section apply to shaft piloted washers of series WS.811 and WS.812 as well as housing piloted washers of series GS.811 and GS.812. Tolerances for the bore diameter of series K.811 and K.812 thrust assemblies are given on tabular page C254.

The tolerances for the bore and outside diameter of series AS thrust washers are shown in Table 2 below. The tolerances for the bore and outside diameter of series LS thrust washers are given in Table 3. Bore inspection procedures for thin thrust washers (AS) and heavy thrust washers (LS) are given on page C230.

## MOUNTING TOLERANCES

Shaft and housing tolerances for mounting metric series cylindrical roller and cage thrust assemblies are given in Table 4 shown below. If the cylindrical rollers of the cylindrical roller and cage thrust assemblies are to run directly on the adjacent support surfaces, these must be hardened to at least 58 HRC. Raceway contact dimensions  $E_a$  and  $E_b$  must be observed.

TABLE 4 – MOUNTING TOLERANCES FOR SHAFTS AND HOUSINGS FOR METRIC SERIES COMPONENTS.

| Bearing Components                                                                          | Shaft Tolerance (shaft piloting) | Housing Tolerance (housing piloting) | Piloting Member |
|---------------------------------------------------------------------------------------------|----------------------------------|--------------------------------------|-----------------|
| Cylindrical roller & needle roller cage thrust assembly<br>Types: AXK, FNT, K.811 and K.812 | h8                               | H10                                  | shaft           |
| Cylindrical roller & needle roller cage thrust assembly<br>Types: AX, AR, AXZ, and ARZ      | h10                              | H10                                  | shaft           |
| Thin thrust washer<br>Type: AS                                                              | h10                              | H11                                  | shaft           |
| Heavy thrust washer<br>Type: LS                                                             | h10                              | H11                                  | shaft           |
| Shaft piloted thrust washer<br>Type: WS.811                                                 | h6 (j6)                          | clearance                            | shaft           |
| Housing piloted thrust washer<br>Type: GS.811                                               | Clearance                        | H7 (K7)                              | housing         |
| Thick, thin and heavy series thrust washers<br>Types: CP and CPR                            | h10                              | H10                                  | as required     |

The backup surfaces for the shaft washers WS.811 and WS.812 as well as the housing washers GS.811 and GS.812 of cylindrical roller thrust bearings must be square with the axis of the shaft. Equally important, the raceway or the surface backing the thrust washer, must not be dished or coned. The permissible limits of the squareness and dishing or coning are shown in figures 1 and 2. When using the thin (AS) thrust washers the cylindrical rollers of the thrust cage assembly must be supported over their entire length.

Out of Square Surface  
Figure 1

Dished or Coned Surface  
Figure 2

Bearing thrust washers should make close contact with the shaft or housing shoulder and must not touch the fillet radius. Therefore the maximum fillet radius  $r_{as\ max}$  must be no greater than the minimum chamfer  $r_{s\ min}$  of the shaft washer (WS) and the housing washer (GS). See tabular page C255.

Since roller thrust bearings generally run under considerable loads, their incorporated washer (and thrust washer) should be supported on a shoulder covering the whole area of circulation of the rollers bounded by dimensions  $E_b$  and  $E_a$ .

## LOAD RATINGS

### MINIMUM AXIAL LOAD

To prevent slippage a cylindrical roller thrust bearing must always be axially loaded. For satisfactory operation a certain minimum load must be applied between the cylindrical rollers and their raceways. This can be calculated from:

$$F_{a\ min} = 0.1 \cdot C_0 / 2200 \quad (\text{kN})$$

where

$C_0$  – static load rating (kN)

$F_{a\ min}$  – minimum axial load (kN)

## NEEDLE ROLLER BEARINGS

### THRUST ASSEMBLIES AND THRUST BEARINGS – INCH SERIES

#### NEEDLE ROLLER AND CAGE THRUST ASSEMBLIES CYLINDRICAL ROLLER AND CAGE THRUST ASSEMBLIES CYLINDRICAL ROLLER THRUST BEARINGS THRUST WASHERS

Thrust assemblies and thrust bearings of inch series are available in a variety of sizes. This catalog includes the most popular, standardized designs. If the back up surfaces cannot be used as raceways, hardened thrust washers are available.

#### REFERENCE STANDARDS ARE:

- **ANSI/ABMA Std. 21.2** – Thrust needle roller and case assemblies and thrust washers - Inch design
- **ANSI/ABMA Std. 24.2** – Thrust bearings of ball and cylindrical roller types - Inch design.

Before selecting specific thrust assemblies or thrust bearings, the engineering section of the catalog should be reviewed.

C

### TYPES OF INCH SERIES THRUST ASSEMBLIES, THRUST BEARINGS AND THRUST WASHERS.

**NTA**  
Needle roller and cage thrust assembly

**NTH**  
Cylindrical roller and cage thrust assembly

**NTHA**  
Cylindrical roller thrust bearing

**TRA...TRD**  
Thrust washers

## IDENTIFICATION

NTA is the complete prefix code for a needle roller and cage thrust assembly with inch nominal dimensions using needle rollers of the smallest practical diameter.

Cylindrical roller and cage thrust assemblies with inch nominal dimensions are identified by the prefix letters NTH. They use large diameter cylindrical rollers providing higher load ratings.

Thrust washers of inch nominal dimensions are identified by the prefix letters TR, followed by another letter such as A, B, or C etc. indicating washer thickness. TRA is the complete prefix code for the thinnest thrust washer made to inch nominal dimensions.

Most thrust washers are intended to be piloted on their bores. Some washers, however, are designed to be piloted on their outside diameters. Such washers are identified by the letter D following the thickness code letter. Thus TRJD is the complete prefix code for a thrust washer with inch nominal dimensions of J thickness and designed to be piloted by its outside diameter.

Cylindrical roller thrust bearings with prefix code NTHA are made up of one NTH assembly, one TRI or TRJ bore piloted washer and one TRID or TRJD outside diameter piloted washer.

Since the bearing designation for thrust assemblies does not appear on the bearing itself, the manufacturer's parts list or another reliable source should always be consulted when ordering bearings for service or field replacement, to make certain that the correct bearing with the correct lubricant is used.

## CONSTRUCTION

Needle roller and cage thrust assemblies (NTA) and cylindrical roller and cage thrust assemblies (NTH) have hardened cages and through hardened, precision ground rollers. The cages are securely fastened assemblies of two mating pieces. This construction minimizes cage stress and assures that the roller retaining function of the cage is unaffected by normal wear. The needle rollers and the cylindrical rollers are precision ground and lapped to close tolerance for optimum load distribution.

Thrust washers for the needle roller and cage thrust assemblies are designed for bore piloting. The thinner thrust washers are tumble burnished and may be out of flat due to heat treatment, but will flatten under load. The raceway surfaces of thick thrust washers are ground and lapped.

Thrust washers for the cylindrical roller and cage thrust assemblies are available in both bore piloted and outside diameter piloted types. Their piloting surfaces are ground and raceway surfaces are ground and lapped.

## DIMENSIONAL ACCURACY

### TOLERANCES FOR NEEDLE ROLLER AND CAGE THRUST ASSEMBLIES

Pages C270-C278 list the nominal outside diameter, bore diameter and the needle roller diameter for the inch needle roller and cage thrust assemblies and their corresponding thrust washers appear in the tabular data.

Tolerances for the bore diameters and outside diameters of inch thrust assemblies are given in Table 1.

TABLE 1 – TOLERANCES FOR BORE ( $D_{c1}$ ) AND OUTSIDE ( $D_c$ ) DIAMETERS OF NOMINAL INCH (NTA) NEEDLE ROLLER AND CAGE THRUST ASSEMBLIES

| Needle Roller Diameter ( $D_w$ ) | Deviations                 |       |        |       |                            |       |        |      |        |

### BORE INSPECTION PROCEDURE FOR ASSEMBLY

The bore diameter ( $D_{c1}$ ) of the assembly should be checked with "go" and "no go" plug gages. The "go" plug gage size is the minimum bore diameter of the assembly. The "no go" plug gage size is the maximum bore diameter of the assembly.

The assembly, under its own free weight, must fall freely from the "go" plug gage. The "no go" plug gage must not enter the bore. Where the "no go" plug gage can be forced through the bore, the assembly must not fall from the gage under its own weight.

### TOLERANCES FOR THRUST WASHERS

Tolerances for the outside diameters and bore diameters of nominal inch thrust washers are given in Tables 2 and 2A.

TABLE 2 – TOLERANCES FOR OUTSIDE DIAMETER ( $d_1$ ) OF NOMINAL INCH (TRA, TRB ETC.) THRUST WASHERS.

| Nominal o.d. |      |       |      | Deviations |        |       |        |
|--------------|------|-------|------|------------|--------|-------|--------|
| >            |      | ≤     |      | high       |        | low   |        |
| mm           | inch | mm    | inch | mm         | inch   | mm    | inch   |
| 6.0          | 0.24 | 133.4 | 5.25 | -0.25      | -0.010 | -0.76 | -0.030 |

TABLE 2A – TOLERANCES FOR BORE DIAMETER ( $d$ ) OF NOMINAL INCH (TRA, TRB, ETC.) THRUST WASHERS.

| Nominal Bore Diameter |      |       |      | Deviations |        |       |        |
|-----------------------|------|-------|------|------------|--------|-------|--------|
| >                     |      | ≤     |      | high       |        | low   |        |
| mm                    | inch | mm    | inch | mm         | inch   | mm    | inch   |
| 6.0                   | 0.24 | 57.2  | 2.25 | 0.05       | +0.002 | +0.30 | +0.012 |
| 57.2                  | 2.25 | 133.4 | 5.25 | +0.05      | +0.002 | +0.43 | +0.017 |

## BORE INSPECTION PROCEDURE FOR THRUST WASHER

The bore diameter (d) of the thrust washer should be checked with “go” and “no go” plug gages. The “go” plug gage size is the minimum bore diameter of the thrust washer. The “no go” plug gage size is the maximum bore diameter of the thrust washer.

The thrust washer, under its own weight, must fall freely from the “go” plug gage. The “no go” plug gage must not enter the bore. Where the “no go” plug gage can be forced through the bore, the thrust washer must not fall from the gage under its own weight.

## TOLERANCES FOR CYLINDRICAL ROLLER THRUST BEARINGS

The tolerances for inch series cylindrical roller thrust bearings, cylindrical roller cage and thrust assemblies and their corresponding component thrust washers appear in the tabular data.

## MOUNTING TOLERANCES

### NEEDLE ROLLER AND CAGE THRUST ASSEMBLIES

On NTA inch type needle roller and cage thrust assemblies the cage bore has a larger contact area and a closer tolerance than the outside diameter. Therefore, bore piloting is preferred for these assemblies. To reduce wear it is suggested that the piloting surface for the cage be hardened to an equivalent of at least 55 HRC.

Where design requirements prevent bore piloting, the NTA needle roller and cage thrust assemblies may be piloted on the outside diameters. It should be noted that the “diameter to clear washer O.D.” given in the tabular data is not suitable for outside diameter piloting. For such cases suitable O.D. piloting dimensions should be determined in consultation with your Timken representative.

### THRUST WASHERS FOR USE WITH NTA NEEDLE ROLLER AND CAGE THRUST ASSEMBLIES

Ideally, a thrust washer should be stationary with respect to, and piloted by, its supporting or backing member, whether or not this is an integral part of the shaft or housing. There should be no rubbing action between the thrust washer and any other machine member. The economics of design, however, often preclude these ideal conditions and thrust washers must be employed in another manner. In such cases design details should be determined in consultation with your Timken representative.

## CYLINDRICAL ROLLER AND CAGE THRUST ASSEMBLIES

Type NTH assembly cage has a relatively large contact area on both the bore and the outside diameter. Thus these assemblies can be piloted by either the shaft or the housing. To reduce wear it is suggested that the piloting surface for the cage be hardened to an equivalent of at least 55 HRC.

When the shaft is used as the piloting surface, the outside diameter of the cage must clear the housing under all conditions. Conversely, when the housing is the piloting surface, the shaft must clear the cage bore under all conditions. It will be noted that the mounting dimensions are given in the tabular data for both shaft and housing piloting. Bore inspection procedure for the assembly given on page C267 should be used for checking the bore of NTH assemblies.

## THRUST WASHERS FOR USE WITH CYLINDRICAL ROLLER AND CAGE THRUST ASSEMBLIES

Types TRID and TRJD thrust washers for use with cylindrical roller and cage thrust assemblies are designed to pilot from the housing and to clear the shaft. Types TRI and TRJ thrust washers are designed to pilot from the shaft and clear the housing. The thrust washers should be stationary with respect to their piloting (or locating) machine members. There should be no rubbing action between the washer and any other machine member.

## BACKUP SURFACES

In some applications it is desirable to use the back up surfaces as raceways for the rollers of the thrust assemblies. When this is done, these surfaces must be hardened to an equivalent of at least 58 HRC. If this hardness cannot be achieved and thrust washers cannot be used, the load ratings must be reduced as explained in the engineering section of this catalog.

Thrust raceway surfaces must be ground to a surface of  $8 \mu\text{in } R_a$  ( $0.20 \mu\text{m } R_a$ ). When this requirement cannot be met, thrust washers must be used.

The raceways against which the rollers operate, or the surfaces against which the thrust washers bear, must be square with the axis of the shaft. Equally important, the raceway, or surface backing the thrust washer, must not be dished or coned. The permissible limits of out-of-squareness and dishing or coning are shown in figures below.

**TYPE NTHA CYLINDRICAL ROLLER THRUST BEARING**

The NTHA cylindrical roller thrust bearing consists of the NTH cylindrical roller and cage thrust assembly and two thrust washers. This bearing is sold as a unit.

A typical mounting of the thrust bearing when the shaft rotates is shown in Figure a. The bore of the rotating, shaft supported thrust washer is ground for an accurate fit on the shaft. The outside diameter of the stationary, housing supported thrust washer is ground for a proper fit in the housing.

The NTHA cylindrical roller thrust bearing cage is normally shaft piloted. In the event it is necessary to pilot the cage by the housing, Figure b illustrates a possible mounting arrangement. When other mounting arrangements are dictated by the application they should be determined in consultation with your Timken representative.

Figure a

Figure b

**LOAD RATINGS**

**MINIMUM AXIAL LOAD**

Slippage can occur if the applied axial load is too light and the operating speed of the needle roller and cage thrust assembly is high, particularly if accompanied by inadequate lubrication. For satisfactory operation a certain minimum load must be applied to a needle roller and cage thrust assembly which can be calculated from:

$$F_{amin} = C_0/2200 \text{ [lbf]}$$

where

- $C_0$  – static load rating [lbf]
- $F_{amin}$  – minimum axial load [lbf]

**Coefficient Of Friction**

In general, the coefficient of friction of a thrust bearing (consisting of a needle roller or a cylindrical roller and cage thrust assembly and thrust washers) is defined as the friction torque divided by the product of the applied load and the bearing pitch radius. This coefficient of friction is not a constant value, but will vary considerably with load, speed and lubricant. Generally, the coefficient of friction becomes smaller as the load is increased and larger as the speed is increased. It is suggested that a value of 0.004 to 0.005 be used as a conservative estimate.

**LUBRICATION**

Oil is the preferred lubricant for needle roller or cylindrical roller and cage thrust assemblies and an ample oil flow is absolutely necessary for high speeds, or for moderate speeds when the load is relatively high.

When the application must utilize grease lubrication the needle roller and cage thrust assembly should be ordered pregreased. When the speeds are low and rotation is not continuous, the initial charge of grease may be suitable for the life of the application. When the speeds are moderate, however, the designer must provide for frequent regreasing. Since the rollers tend to expel the lubricant radially outward, relubrication passages should be directed to the bore of the cage whether oil or grease is used as the lubricant.

**SPECIAL DESIGNS**

Needle roller and cage thrust assemblies and thrust washers are also made to special dimensions and configurations, as well as from special materials, when quantities permit economical manufacture.

Needle roller and cage thrust assemblies are particularly adaptable to low cost integral combinations with special thrust washers. When the use of such special designs are considered, the following pages should be reviewed for evaluation of proposed arrangements.

# NEEDLE ROLLER BEARINGS

## NEEDLE ROLLER AND CAGE THRUST ASSEMBLIES, THRUST WASHERS

### METRIC AND INCH SERIES

- Dimensions for bore and O.D. of thrust assemblies and washers are nominal.
- See page C268 for details on piloting and backup surfaces.
- Thrust washers burnished at least one-quarter of bore area (remainder is rough breakaway finish).
- O.D. finish of washers will be as blanked.
- Thinner washers may be out of flat due to distortion in hardening in the free state (expected to flatten out under load).

| Shaft Diameter | Dimensions mm/in. |                 |                  |                |                 | Assembly Designation | Load Ratings kN/lbf. |               | Limiting Speed Oil RPM | Wt. kg/lbs.    |

Δ If the shaft and the housing adjacent to the bearing O.D. are not concentric, the T.I.R. between the shaft and housing should be added to this dimension.

*Continued on next page.*

# NEEDLE ROLLER BEARINGS

## NEEDLE ROLLER AND CAGE THRUST ASSEMBLIES, THRUST WASHERS — *continued*

### METRIC AND INCH SERIES

- Dimensions for bore and O.D. of thrust assemblies and washers are nominal.
- See page C270 for details on piloting and backup surfaces.
- Thrust washers burnished at least one-quarter of bore area (remainder is rough breakaway finish).
- O.D. finish of washers will be as blanked.
- Thinner washers may be out of flat due to distortion in hardening in the free state (expected to flatten out under load).

# NEEDLE ROLLER BEARINGS

## NEEDLE ROLLER AND CAGE THRUST ASSEMBLIES, THRUST WASHERS — *continued*

### METRIC AND INCH SERIES

- Dimensions for bore and O.D. of thrust assemblies and washers are nominal.
- See page C268 for details on piloting and backup surfaces.
- Thrust washers burnished at least one-quarter of bore area (remainder is rough breakaway finish).
- O.D. finish of washers will be as blanked.
- Thinner washers may be out of flat due to distortion in hardening in the free state (expected to flatten out under load).

Δ If the shaft and the housing adjacent to the bearing O.D. are not concentric, the T.I.R. between the shaft and housing should be added to this dimension.

Continued on next page.

# NEEDLE ROLLER BEARINGS

## NEEDLE ROLLER AND CAGE THRUST ASSEMBLIES, THRUST WASHERS — *continued*

### METRIC AND INCH SERIES

- Dimensions for bore and O.D. of thrust assemblies and washers are nominal.
- See page C268 for details on piloting and backup surfaces.
- Thrust washers burnished at least one-quarter of bore area (remainder is rough breakaway finish).
- O.D. finish of washers will be as blanked.
- Thinner washers may be out of flat due to distortion in hardening in the free state (expected to flatten out under load).

**CYLINDRICAL ROLLER THRUST BEARINGS**

- Check for availability.
- The NTHA thrust cylindrical roller bearing consists of an NTH cage and roller assembly, one bore piloted washer and one O.D. piloted washer. The NTHA bearing is identified and sold as a unit, and is manufactured to inch nominal dimensions only.
- Load ratings given are identical to the corresponding NTH thrust cylindrical roller and cage assembly.
- It is suggested that the cage and roller assembly be bore piloted when applying NTHA bearings. When different arrangements of piloting are required, please contact your Timken representative.
- Back-up surfaces should be flat and square with the center line of the shaft.
- To order individual thrust washers see washer designation below.

## **NEEDLE ROLLER BEARINGS**

### **NOTES**

C

## COMBINATION BEARINGS

**Overview:** Combined bearings incorporate a radial needle roller bearing and a thrust roller bearing into a convenient unitized package.

- **Sizes:** 5 mm - 70 mm (0.197 in. - 2.756 in.) bore.
- **Markets:** Industrial applications, machine tools, and automotive transmissions.
- **Features:** Available with needle roller or cylindrical roller thrust component, machined and drawn outer rings are available, some sizes available with integral dust caps.
- **Benefits:** An effective alternative to separate radial and thrust bearings.

C

## Combined Needle Roller Bearings - Metric Nominal Dimensions

**Prefix**  
**RAX** radial needle roller and thrust needle (or cylindrical) roller bearing without inner ring or thrust washer  
**RAXF** closed end drawn cup design radial needle roller and needle thrust roller bearing without inner ring or thrust washer  
**RAXZ** unitized machined outer ring thrust cylindrical roller and radial needle roller bearing

**RAXF** **7** **15** **TC**

**Suffix**  
**TB** radial play under rollers set to lower half of F6 tolerance  
**TC** radial play under rollers set to upper half of F6 tolerance

**NAXR** **20** **Z.TN**

**Suffix**  
**TN** molded polymer retainer  
**Z** thrust washer retaining dust cap

**Bore diameter**  
 20 = 20 mm

**Series**  
**NAXR** machined outer ring thrust cylindrical roller and radial needle roller bearing without inner ring  
**700** drawn cup design radial needle roller and needle thrust roller bearing without inner ring or thrust washer  
**400** machined ring radial needle roller and thrust needle roller bearing without inner ring or thrust washer  
**500** machined ring radial needle roller and thrust cylindrical roller bearing

## Inner rings for Combined Needle Roller Bearings - Metric Nominal Dimensions

**Prefix**  
**JR** inner ring for use with NAXR series bearings

**JR** **25** x **30** x **18**

**IM** **10** **14** **16** **P**

**Bore diameter**  
 25 = 25 mm

**Width**  
 18 = 18 mm

**Outside diameter**  
 14 = 14 mm

**Prefix**  
**IM** inner ring for use non-NAXR series bearings

**Suffix**  
**P** ISO 492 tolerated inner ring

## Thrust Washers for Combined Needle Roller Bearings - Metric Nominal Dimensions

**Prefix**  
**CP** thrust washer for metric needle roller bearings

**CP** **15** **28** — Thin Washer designation

**CP** **2** **15** **28** — Thick Washer designation

**Thickness**  
 2 = 2 mm

**Outside diameter**  
 28 = 28 mm

**Bore diameter**  
 15 = 15 mm

## NEEDLE ROLLER BEARINGS

### COMBINED BEARINGS – METRIC SERIES

Timken® Torrington® combined bearings consist of a radial bearing (needle roller bearing) and a thrust bearing (roller or needle bearing). The thrust roller bearing is usually a cylindrical roller thrust bearing.

Combined bearings make an effective alternative in place of two separate bearings in terms of cost, handling and packaging. Combined bearings are possible to use with or without matching inner rings and thrust washers, though these are listed opposite the bearing part numbers, where possible, in the following pages of tables, for convenience.

#### REFERENCE STANDARDS ARE:

- **DIN 5429, Part 1** – Needle roller – thrust cylindrical roller bearings, series NAXR, NAXR.Z
- **ISO 1206** – Needle roller bearings – light and medium series – dimensions and tolerances

### CONSTRUCTION

Needle roller – cylindrical roller thrust bearings of series NAXR and RAXZ 500 are available with dust caps. They have the highest axial load carrying capability of all combined bearings.

Combined bearings of series RAX 700 use a thin, one-piece outer ring design similar in construction to metric drawn cups. The RAX 700 Series is available with an open or closed (RAXF) design, as are standard drawn cups. These bearings use needle rollers for both their radial and thrust complements.

The RAX 400 Series uses needle rollers for both their radial and thrust complements, as with the RAX 700 Series, but are constructed from two separate machined rings joined with a strong metal insert. The RAX 500 Series, fabricated like the 400 Series, uses heavier cylindrical rollers for their thrust complement. Both series are available with matching thrust washers and inner rings and should be considered for applications requiring higher load capacity and running accuracy.

Each of the previous two bearing types may be best used without inner rings because the radial internal clearances are smaller if the needle roller and cage assemblies operate directly on a hardened and ground shaft. Tolerance class F6 is the normal specification for the needle roller complement bore diameters of the unmounted bearings.

RAX 400 and 500 Series (without inner rings) can be supplied with a smaller radial clearance if desired. Refer to the suffix options TB and TC as listed in the chart above.

Quality requirements for shafts when used as a bearing raceway are given in the engineering section of this catalog. When it becomes impractical to meet the shaft raceway design requirements, standard inner rings may be used with these bearings.

## DIMENSIONAL ACCURACY

### TOLERANCES

Metric series combined bearings (except Series RAX 700) are manufactured to the normal tolerances which apply to the metric series radial bearings and standard thrust bearings as shown in the engineering section. The only exceptions are: the diameter tolerances of the shaft piloted washer and the bearing width tolerances shown in cross-sectional views listed on the tables in the pages provided.

Because of the nature of the RAX 700 Series design, these bearings must be inspected with suitable plug (GO and NO GO) and ring gages corresponding to metric drawn cups of equivalent bore and O.D. sizes.

The matching thrust washer thickness tolerances may be found in the metric unitized thrust bearing section of this catalog.

## BEARING MOUNTING

### MOUNTING DIMENSIONS

Simple, through-bored housings are adequate for combined bearings. The mounting tolerances for the mechanical ring combined bearings are provided in Table 1.

The shaft piloted washers of combined bearings must be supported at least over half their width. Other quality requirements for shafts and housings are given in the engineering section of this catalog. Requirements for fillets, recesses and shoulder heights are the same as for needle roller bearings as shown in "Mounting dimensions" paragraph on pages C102-C103.

When mounting these bearings in their housings with a tight fit, relatively high press-in forces will be required which may brinell the raceways of the thrust bearing arrangements. Particular care should be exercised when installing needle roller - cylindrical roller thrust bearings with dust caps and where the roller assembly of the thrust bearings cannot be removed. In order to avoid brinelling of the thrust bearing raceways the bearings should be installed with uniform, continuous pressure against the installation tool, avoiding sudden impact forces. At times it may even be desirable to heat the housing before bearing mounting.

TABLE 1 – MOUNTING TOLERANCES

| Rotation Conditions                 | ISO tolerance zone for housing | Nominal shaft diameter, d mm |    | ISO tolerance zone for shaft |                    |
|-------------------------------------|--------------------------------|------------------------------|----|------------------------------|--------------------|
|                                     |                                | >                            | ≤  | With Inner Ring              | Without Inner Ring |
| Load Stationary Relative to Housing | K6 (M6) <sup>1</sup>           | 10                           | 40 | k6                           | h6                 |
|                                     |                                | 40                           | 70 | m6                           | h6                 |

| RAX 700<br>RAXF 700                 | H6 (H7)                        | all diameters                |    | k5                           | h5 (h6)            |

<sup>1</sup> Tighter fit for more secure arrangement

## LUBRICATION

When the applied axial loads are relatively high and the application allows the use of oil as the desired method of lubrication, bearing types NAXR and NAXK should be given consideration. Combined bearings with a dust cap may use oil lubrication although their design makes them better suited for use with grease lubrication.

Combined bearings are typically shipped protected with a corrosion-preventive compound which is not a lubricant. The bearings may be used in oil or grease lubricated applications without removal of the corrosion preventive compound, although to avoid subsequent recognition problems it may be advisable to remove the corrosion preventive compound before packing the bearings with a suitable grease.

## LOAD RATINGS

Minimum axial load for combined bearings excluding RAX700:

$$F_{\text{amin}} = C_0 / 2200 \quad (\text{kN})$$

$$\text{where } C_0 = \text{static load rating} \quad (\text{kN})$$

## DYNAMIC EQUIVALENT LOAD

Combined bearings can accommodate radial and axial loads.

Radial needle roller complement

$$P = F_r \quad (\text{kN})$$

Cylindrical or needle roller thrust complement

$$P_a = F_a \quad (\text{kN})$$

## STATIC EQUIVALENT LOAD

For all combined bearings series:

Radial needle roller complement

$$P_0 = F_r \quad (\text{kN})$$

Cylindrical or needle roller thrust complement

$$P_{0a} = F_a \quad (\text{kN})$$

C

## **NEEDLE ROLLER BEARINGS**

### **NOTES**

C

## DRAWN CUP ROLLER CLUTCHES

**Overview:** Drawn cup needle roller clutches are similar to drawn cup needle bearings in design, but allow free rotation in only one direction while transmitting torque in the opposite direction. These designs use the same small radial section as drawn cup needle roller bearings and are offered as clutch-only units or as clutch and bearing assemblies.

- **Sizes:** 3 mm - 35 mm bore ( $1/8$  in. - 1.4 in.) bore.
- **Markets:** Office equipment, paper-towel dispensers, exercise equipment, appliances and two-speed gearboxes.
- **Features:** Compact, lightweight and operate directly on a hardened shaft.
- **Benefits:** Installation is easily accomplished with a simple press fit.

## Drawn Cup Roller Clutches

### Metric Series

- FCS, FC-K** regular clutch, single roller per stainless steel spring
- FC** regular clutch, multi-roller per stainless steel spring
- FCL-K** light series clutch, single roller per stainless steel spring
- FCB** regular clutch and bearing assembly, multi-roller per stainless steel spring
- FCBL-K, FCBN -K** light series clutch and bearing assembly, single roller per stainless steel spring

**FCL - 10 - K**

Bore, in millimeters

### Inch Series

- RC** regular clutch, single roller per integral spring
- RC-FS** regular clutch, single roller per stainless steel spring
- RCB** regular clutch and bearing assembly, single roller per integral spring
- RCB-FS** regular clutch and bearing assembly, single roller per stainless steel spring

Outside Diameter  
14 =  $1\frac{1}{16}$  =  $\frac{7}{8}$  in.

**RC - 10    14    10 - FS**

Bore  
10 =  $\frac{10}{16}$  =  $\frac{5}{8}$  in.

Width  
10 =  $\frac{10}{16}$  =  $\frac{5}{8}$  in.

## NEEDLE ROLLER BEARINGS

### DRAWN CUP ROLLER CLUTCHES

#### METRIC AND INCH SERIES

The Timken® Torrington® drawn cup roller clutch transmits torque between shaft and housing in one direction and allows free overrun in the opposite direction. When transmitting torque, either the shaft or the housing can be the input member. Applications are generally described as indexing, backstopping or overrunning.

#### LOCK FUNCTION

Shaft drives gear clockwise (white arrows)

or gear can drive shaft counter-clockwise (black arrows)

#### OVERRUN FUNCTION

Shaft overruns in gear counter clockwise (white arrows)

or gear overruns on shaft clockwise (black arrow)

C

### IDENTIFICATION

The prefix letters in the designation of the Timken Torrington drawn cup roller clutches and drawn cup roller clutch and bearing assemblies denote whether these are manufactured to metric or inch nominal dimensions. Designation codes for clutches and clutch and bearing assemblies with metric nominal dimensions begin with the letter "F". Designation codes for clutches and clutch and bearing assemblies with inch nominal dimensions begin with the letter "R".

The basic types of clutches and clutch and bearing assemblies are listed below:

#### METRIC SERIES TYPES

- FCS, FC-K** regular clutch, single roller per stainless steel spring
- FC** regular clutch, multi-roller per stainless steel spring
- FCB** regular clutch and bearing assembly, multi-roller per stainless steel spring
- FCL-K** light series clutch, single roller per stainless steel spring
- FCBL-K** light series clutch and bearing assembly, single roller per stainless steel spring.

#### INCH SERIES TYPES

- RC** regular clutch, single roller per integral spring
- RC-FS** regular clutch, single roller per stainless steel spring
- RCB** regular clutch and bearing assembly, single roller per integral spring
- RCB-FS** regular clutch and bearing assembly, single roller per stainless steel spring

### Types Of Clutches And Clutch And Bearing Assemblies

Drawn Cup Roller Clutch Type FC with Steel Springs

Drawn Cup Clutch & Bearing Assembly Type FCB with Steel Springs

Drawn Cup Roller Clutch, Types FCS, FC-K, FCL-K, and RC-FS with Steel Springs

Drawn Cup Clutch & Bearing Assembly Types FCBL-K and RCB-FS with Steel Springs

Drawn Cup Roller Clutch, Type RC with Integral Springs

Drawn Cup Clutch & Bearing Assembly Type RCB with Integral Springs

## CONSTRUCTION

In many respects, construction is similar to that of drawn cup bearings. Design and manufacture of drawn cup clutches, just as with drawn cup bearings, was pioneered and developed by Timken. The well established design utilizes the same low profile radial section as drawn cup bearings. The precisely formed interior ramps provide surfaces against which the needle rollers wedge to positively lock the clutch with the shaft when rotated in the proper direction. These ramps, formed during the operation of drawing the cup, are case hardened to assure long wear life. The incorporation of ramp forming into the cup drawing operation is a manufacturing innovation that contributes much to the low cost of the unit.

Two designs of precision molded clutch cages are employed. Clutch and clutch and bearing assembly types FC, FC-K, FCS, FCL-K, RC-FS, FCB, FCBL-K and RCB-FS use a glass fiber reinforced nylon cage equipped with inserted stainless steel leaf springs. The stainless steel springs permit higher rates of clutch engagement and achieve greater spring life. The nylon cage permits operation at higher temperatures. Clutch types RC and RCB utilize a one-piece cage of acetyl resin plastic with integral leaf style springs used for lower temperatures than permitted for the units with nylon cages.

Types FCB, FCBL-K, RCB and RCB-FS clutch and bearing assemblies have cages for retention and guidance of the needle rollers in the bearings located on both sides of the clutch unit.

Clutch And Bearing Assembly

Types FC, FC-K, FCS, FCL-K, RC and RC-FS are of clutch-only configurations for use with external radial support (usually two drawn cup needle roller bearings). Separate bearings position the shaft and housing concentrically and carry the radial load during overrun.

Clutch Only

## OPERATION

Operation is in two modes; the overrun mode and the lock mode. Operational mode is controlled by the direction of the clutch or shaft rotation with respect to the locking ramps.

In the overrun mode shown in the drawings below, the relative rotation between the housed clutch and the shaft causes the rollers to move away from their locking position against the locking ramps in the drawn cup. The housing and the clutch are then free to overrun in one direction, or the shaft is free to overrun in the other direction.

In the lock mode shown in the drawings below, the relative rotation between the housed clutch and the shaft is opposite to that in the overrun mode. The rollers, assisted by the leaf type springs, become wedged between the locking ramps and the shaft to transmit torque between the two members. Either the member housing the clutch drives the shaft in one direction, or the shaft can drive the clutch and its housing member in the other direction.

Clearance between the rollers and cup ramps is exaggerated in these drawings.

# NEEDLE ROLLER BEARINGS

## APPLICATION

Timken® Torrington® clutches and clutch and bearing assemblies are successfully applied in a wide range of commercial products where indexing, backstopping and overrunning operations must be performed reliably. The sketches on these pages illustrate some of the many possible uses.

When applying the clutch-only unit, separate bearings on each side of the clutch are required to position the shaft concentrically with the housing and to carry the radial loads during overrun. Drawn cup needle roller bearings with the same radial section as the clutch should be used in the through bored housings for simplicity and economy. Two clutches can be used side by side for greater torque capacity.

Where the radial loads are light, the clutch and bearing assembly can be used without additional support bearings. This reduces the overall assembly width, the number of stocked and ordered parts, and assembly costs as well.

Timken Torrington drawn cup roller clutches are manufactured to commercial hardware standards and are used extensively in appliances, business machines, industrial and recreation equipment and a wide range of other applications.

Clutch & Bearing Arrangement

for Heavy Loads

Clutch & Bearing Assembly

for Light Loads

In any application where our clutch may be considered, it will be part of a system in which the operating conditions and the clutch mounting will affect its function. Before any clutch selection is made, it is important that the following catalog section be carefully studied to understand the effects of these factors. Consideration should be given to operating conditions such as:

- Magnitude of externally applied torque as well as inertial torque.
- Magnitude of applied radial loads during overrunning.
- Potential for vibration or axial shaft movement within the clutch during engagement.
- Engagement rate, as it pertains to the selection of stainless steel or plastic leaf springs.
- Oil lubricant supply during high overrunning speeds.
- External and internal environmental temperatures that can affect clutch performance.
- Lubricant selection effect on clutch engagement.
- Indexing inaccuracies resulting from backlash [lost motion].

Consideration should be given to the shaft and housing design requirements such as:

- Shaft hardness and strength particularly when approaching torque rating limits.
- Shaft roundness, taper and surface finish necessary to ensure sufficient fatigue life and torque carrying ability.
- Housing strength [hardness and cross section] to support the applied torque loads.
- Housing roundness, taper and surface finish necessary to ensure uniform torque and load distribution.

A test program under all expected operating conditions should be carried out before putting a new application into production. Timken customer engineers are constantly working with and testing new applications, and, their experience can be of great help to the designer considering the use of a drawn cup roller clutch.

### HOUSING DESIGN

Drawn cup clutches and clutch and bearing assemblies are mounted with a simple press fit in their housings. Through-bored and chamfered housings are preferred. A 30° angle is suggested and care should be taken to round the edge where the chamfer meets the housing bore. A sharp edge at this location can greatly increase installation forces. Provisions for axial location, such as shoulders or snap rings, are not required. The case hardened cups have a long fatigue life, but must be properly supported to

realize this benefit. Steel housings are preferred and must be used for applications involving high torque loads to prevent radial expansion of the clutch cups. The suggested minimum housing outside diameters in the tables of dimensions are for steel.

The housing bore should be round within one-half of the diameter tolerance.

The taper within the length of the outer ring should not exceed 0.013 mm (.0005 inch).

The surface finish of the housing bore should not exceed 1.6 mm  $R_a$  (63 microinches  $R_a$ ).

The torque ratings given in the clutch tables are based on a steel housing of a large section. When other housing material must be used (such as aluminum, powdered metal and plastics) the torque rating of the clutch will be reduced. Such housings may be satisfactory for lightly torqued applications but your Timken representative should be consulted for appropriate housing and shaft suggestions. Otherwise, an insufficient press fit and use of a lower strength housing material can result in more internal clearance and reduced performance of the clutch.

When using non-steel housings, thorough testing of the design is suggested.

Adhesive compounds can be used to prevent creeping rotation of the clutch in plastic housings with low friction properties. Adhesives will not provide proper support in oversized metal housings. When using adhesives, care must be taken to keep the adhesive out of the clutches and bearings.

### SHAFT DESIGN

The clutch or clutch and bearing assembly operates directly on the shaft whose specifications of dimension, hardness and surface finish are well within standard manufacturing limits.

Either case hardening or through-hardening grades of good bearing quality steel are satisfactory for raceways. Steels modified for free machining, such as those high in sulfur content and particularly those containing lead, are seldom satisfactory for raceways.

For long fatigue life, the shaft raceway, must have a hardness equivalent to 58 HRC, and ground to the suggested diameter shown in the tables of dimensions. It may be through hardened, or it may be case hardened, with an effective case depth of 0.4 mm (0.015 inch). (Effective case depth is defined as the distance from the surface inward to the equivalent of 50 HRC hardness level after grinding.)

Taper within the length of the raceway should not exceed 0.008 mm (0.0003 inch), or one-half the diameter tolerance, whichever is smaller. The radial deviation from true circular form of the raceway should not exceed 0.0025 mm (0.0001 inch) for diameters up to and including 25 mm (1.0 inch). For raceways greater than 25 mm (1.0 inch) the allowable radial deviation should not exceed 0.0025 mm (0.0001 inch) multiplied by a factor of the raceway diameter divided by 25 (1.0 inch). Surface finish on the raceway should not exceed 0.4 mm (16 microinches)  $R_a$ . Deviations will reduce the load capacity and fatigue life of the shaft.

## NEEDLE ROLLER BEARINGS

### INSTALLATION

Simplicity of installation promotes additional cost savings. The drawn cup roller clutch, or the clutch and bearing assembly, must be pressed into its housing. Procedures are virtually identical with those for installing drawn cup bearings as detailed on pages C40 and C62. The unit is pressed into the bore of a gear hub or pulley hub, or housing of the proper size, and no shoulders, splines, keys, screws or snap rings are required.

Installation procedures are summarized in the following sketches:

Use an arbor press or hydraulic ram press which will exert steady pressure. Never use a hammer or other tool requiring pounding to drive the clutch into its housing.

Amount of Recess

Make sure that the housing bore is chamfered to permit easy introduction of the clutch and bearing or the clutch unit. Press unit slightly beyond the chamfer in the housing bore to assure full seating. Through-bored housings are always preferred. If the housing has a shoulder, never seat the clutch against the shoulder. For further details see pages C40 and C62.

**IMPORTANT:** The mounted clutch or clutch and bearing assembly engages when the housing is rotated relative to the shaft in the direction of the arrow and LOCK marking [LOCK] stamped on the cup. Make sure that the unit is oriented properly before pressing it into its housing.

Use an installation tool as shown in the diagram above. If clutch is straddled by needle roller bearings, press units into position in proper sequence and preferably leave a small clearance between units.

When assembling the shaft, it should be rotated in the overrun direction during insertion. The end of the shaft should have a large chamfer or rounding.

## APPLIED LOADS

The clutch-only unit is designed to transmit purely torque loads. Applied torque should not exceed the catalog ratings which are based on the compressive strength of well-aligned clutch components. Bearings on either side of the clutch are to assure concentricity between the shaft and the housing and to support radial loads during clutch overrun. Integral clutch and bearing assemblies are available for this purpose where the radial loads are light. The total maximum dynamic radial load that may be shared by the two needle roller and cage radial bearing assemblies should not be greater than C/3.

In determining the total torque load on a clutch, it is essential to consider the torque due to inertial forces developed in the mechanism, in addition to the externally applied torque. The larger the clutch and the greater the mass of the mechanism controlled by it, the more important this consideration becomes.

Clutch lockup depends on friction. For this reason applications involving severe vibrations or axial motion of the shaft within the clutch are to be avoided. The applications where there are overhanging or overturning loads should incorporate bearings that will maintain alignment between the shaft and the clutch housing. Consult your Timken representative for suggestions.

## LUBRICATION

Oil is the preferred lubricant, as it minimizes wear and heat generation. For those applications where oil is not practical, clutches are packed with a soft grease containing mineral oil. Thick grease will retard roller engagement and can cause individual rollers to slip, possibly overloading any engaged rollers.

## TEMPERATURE

Temperature extremes can cause clutch malfunctions and failure. The molded plastic cage with integral springs holds its necessary resiliency and strength when the operating temperature within the clutch is kept below 90 degrees Celsius (200 degrees Fahrenheit). The clutch with reinforced nylon cage and separate steel springs operates well at temperatures up to 120 degrees C (250 degrees Fahrenheit) continuously and to 150 degrees Celsius (300 degrees Fahrenheit) intermittently. Excessive thickening of the lubricant at low temperatures may prevent some or all of the rollers from engaging. New applications should be tested under expected operating conditions to determine whether or not temperature problems exist.

## BACKLASH

Backlash, or lost motion, prior to engagement is minimal. The variation in backlash from one cycle to another is extremely low. Grease lubrication or improper fitup [housing bore and shaft diameter] may increase backlash. Angular displacement between the shaft and housing increases as an applied torque load is increased.

## RATE OF ENGAGEMENT

Clutch lockup depends upon static friction. Axial motion between shaft and clutch rollers prevents lockup.

Clutches with integral springs engage satisfactorily at cyclic rates up to 200 engagements per minute. Intermittent operation at higher rates has been successful. The steel spring type clutches have proven dependability at rates up to 6000 or 7000 engagements per minute. Even higher cyclic rates may be practical. Since grease may impair engagement at high cyclic rates, a light oil should be used.

## OVERRUN LIMIT SPEED

Exact limiting speeds are not easily predictable. The value for each clutch given in the tabular data is not absolute but serves as a guide for the designer. Oil lubrication is absolutely necessary for high speed operations. Consult your Timken representative when overrunning speeds are high.

## INSPECTION

Although the outer cup of the clutch is accurately drawn from strip steel, it can go slightly out of round during heat treat. When the assembly is pressed into a ring gage or properly prepared housing of correct size and wall thickness, it becomes round and properly sized. Direct measurement of the outside diameter of a drawn cup assembly is an incorrect procedure. The proper inspection procedure is as follows:

1. Press the assembly into a ring gage of the proper size as given in the tabular data.
2. Gage the bore with the specified plug gages of the proper size, as given in the tables of dimensions.
  - a. The locking plug is rotated to insure lockup when the clutch is operated at low limit shaft and is mounted in a high limit housing strong enough to properly size the clutch.
  - b. The overrun plug is rotated to ensure free over-running when the clutch is operated on a high limit shaft and is mounted in a low limit housing.
  - c. The go plug and no go plug insure proper size of the bearings in the clutch and bearing assemblies.

Gage sizes are listed in the tables of dimensions. Plug gage sizes reflect adjustment for the loose and tight conditions resulting from high or low housings or shafts.

C

# NEEDLE ROLLER BEARINGS

## DRAWN CUP ROLLER CLUTCHES

### METRIC SERIES

- For proper application, separate bearings suggested (adjacent to clutch) to carry radial loads and assure concentricity between shaft and housing.
- Clutch engages when housing rotated (relative to the shaft) in direction of arrow marking [LOCK] as labeled on cup
- Proper inspection requires use of ring gage and bore plug gage(s) — see the inspection section page C307.
- Full details on installation given on page C306.

- Shaft raceway and housing bore diameters necessary for proper mounting and operation are listed on the opposite page.
- Types FC, FCS, FC-K and FCL-K clutches have stainless steel springs inserted in molded cage to position rollers for lockup.

The mounted clutch and bearing assembly engages when the housing is rotated relative to the shaft in the direction of the arrow marking [← LOCK] stamped on the cup

# NEEDLE ROLLER BEARINGS

## DRAWN CUP ROLLER CLUTCHES AND BEARING ASSEMBLIES

### METRIC SERIES

- Clutch and bearing assembly engages when housing rotated (relative to shaft) in direction of arrow marking [LOCK] as labeled on cup.
- Shaft raceway and housing bore diameters necessary for proper mounting and operation are listed on the opposite page.
- Proper inspection requires use of ring gage and bore plug gage(s) — see the inspection section page C307.

- Full details on installation given on page C306.
- Types FCB, FCBL-L and FCBN-K clutch and bearing assemblies have stainless steel springs inserted in molded cage to position rollers for lockup.

The mounted clutch and bearing assembly engages when the housing is rotated relative to the shaft in the direction of the arrow marking [← LOCK] stamped on the cup

# NEEDLE ROLLER BEARINGS

## DRAWN CUP ROLLER CLUTCHES

### INCH SERIES

- For proper application, separate bearings suggested (adjacent to clutch) to carry radial loads and assure concentricity between shaft and housing.
- Clutch engages when housing rotated (relative to the shaft) in direction of arrow marking [LOCK] as labeled on cup.
- Proper inspection requires use of ring gage and bore plug gage(s) — see the inspection section page C307.
- Full details on installation given on page C306.

- Shaft raceway and housing bore diameters necessary for proper mounting and operation are listed on the opposite page.
- Type RCFS clutches have stainless steel springs inserted in molded cage to position rollers for lockup.

The mounted clutch engages when the housing is rotated relative to the shaft in the direction of the arrow marking [← LOCK] stamped on the cup.

## NEEDLE ROLLER BEARINGS

### DRAWN CUP ROLLER CLUTCH AND BEARING ASSEMBLIES

#### INCH SERIES

- Clutch and bearing assembly engages when housing rotated (relative to shaft) in direction of arrow marking [LOCK] as labeled on cup.
- Shaft raceway and housing bore diameters necessary for proper mounting and operation are listed.
- Proper inspection requires use of ring gage and bore plug gage(s) — see the inspection section page C307.

- Full details on installation given on page C306.
- Clutch and bearing assemblies have spring integrally molded (type RCB) stainless steel springs inserted (type RCB-FS) in molded cage to position rollers for lockup.

The mounted clutch and bearing assemblies engages when the housing is rotated relative to the shaft in the direction of the arrow marking [← LOCK] stamped on the cup.

\* Suffix "-FS" is not always stamped on the clutch cup. Type RC-FS with stainless steel springs is always readily identified by RED clutch cage.

## **NEEDLE ROLLER BEARINGS**

### **NOTES**

C

## NEEDLE ROLLER BEARING ACCESSORIES

### NEEDLE/CYLINDRICAL ROLLERS

**Overview:** Loose needle and cylindrical rollers are mainly used as bearing rolling elements to reduce friction and torque in rotating and pivoting applications. However, these precision rollers have many other uses such as shafts or locating pins.

- **Sizes:** Diameters from 1.5 mm (0.0591 in.) to 14 mm (0.551 in.). Lengths from 5 mm (0.20 in.) to 57.2 mm (1.25 in.).
- **Markets:** Vehicle and industrial transmissions, universal joints, and two-cycle engines.
- **Features:** Cylindrical and needle sizes are available. Needle rollers are available with flat and rounded ends, metric series needle rollers available in Grade 2, 3 or 5.
- **Benefits:** Provide the maximum load carrying capacity within the smallest envelope at a low cost.

### METRIC INNER RINGS

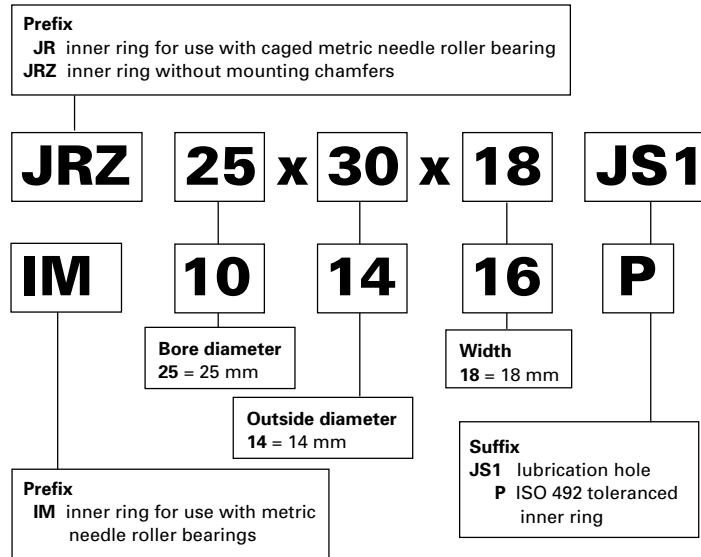

**Overview:** Inner rings are made from bearing quality steel and their O.D. and bore are precision ground. They function as the inner raceway for a needle roller bearing by providing a surface that meets all shaft raceway design requirements (hardness, surface finish, roundness, etc.).

- **Sizes:** 5 mm (0.197 in.) bore to 180 mm (7.087 in.) outside diameter.
- **Markets:** Automotive, truck, power transmissions, and industrial applications.
- **Features:** Available with and without chamfers, some are available with a profiled outside diameter.
- **Benefits:** When it is not practical to manufacture the shaft to raceway quality, an inner ring allows a customer to obtain acceptable bearing performance.

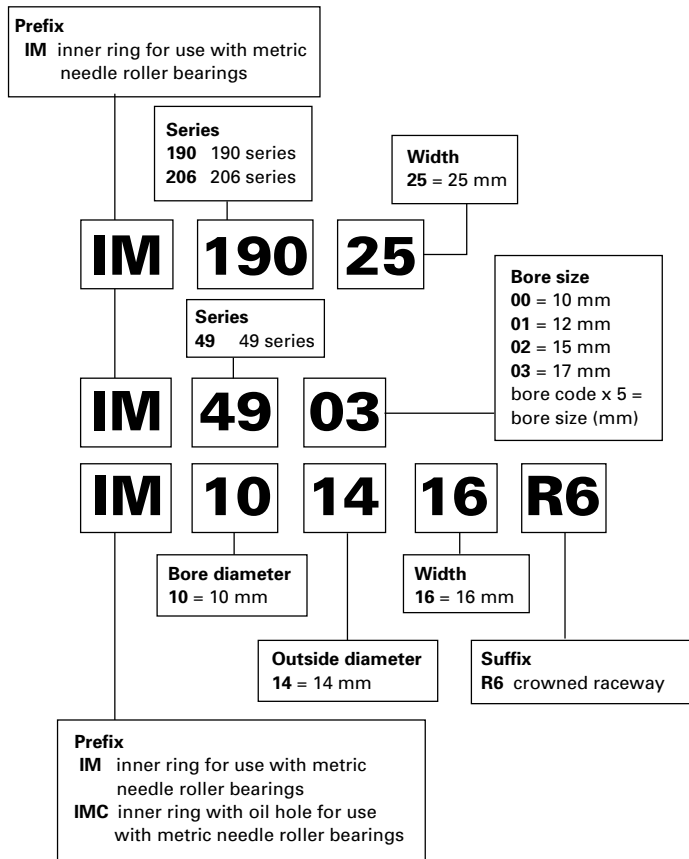

## Standard Inner Rings for Needle Roller Bearings - Metric Nominal Dimensions

## Extra Wide Inner Rings for Needle Roller Bearings - Metric Nominal Dimensions

## Inner Rings for Full Complement Needle Roller Bearings - Metric Nominal Dimensions

## Loose Rollers - Metric Nominal Dimensions

## NEEDLE ROLLER BEARINGS

Flat End

Rounded End

C

### NEEDLE ROLLERS – METRIC SERIES

Needle rollers are made from rolling bearing quality steel hardened to 60-64 HRC or equivalent. Nominal metric needle rollers in various grades are standardized at national and international levels. The grades determine the dimensional and form tolerances of the needle rollers. Metric series needle rollers may differ by their end form: type A has rounded ends and type B has flat ends. Timken prefers to supply needle rollers in the most economical flat end or type B design in G2 grade. Metric series needle rollers of type A may also be made available on request, and in other G3 or G5 grades.

### METRIC SERIES NEEDLE ROLLER DIMENSIONS

Nominally metric needle rollers, conforming to the International Standard ISO 3096, are shown in Table 1. The symbols used in Table 1 as well as in subsequent tables and figures are summarized in Table 5. Needle rollers with flat ends, which are the preferred design are shown in Table 1. Chamfer dimension limits are also shown, the use of which results in the maximum possible effective contact length between roller and raceway. Yet, the relieves at the needle roller ends help to reduce stress concentration resulting in more uniform stress distribution, optimum load ratings, and longer life.

Every needle roller gage is separately packed and the packages are marked accordingly.

### Reference standards are:

- **ISO 3096** – Rolling bearings – Needle rollers – Dimensions and tolerances
- **DIN 5402** – Sheet 3 – Rolling bearing components – Needle rollers.

### EXAMPLE OF METRIC SERIES NEEDLE ROLLER DESIGNATION AND PACKAGE MARKING:

NRO.B1,5x13,8G2  
M2M4

- NRO – Needle roller
- .B – Flat end needle rollers
- 1,5 – Nominal diameter  $D_w = 1,5$  mm
- 13,8 – Nominal length  $L_w = 13,8$  mm
- G2 – Needle roller grade (see table 2)
- M2M4 – deviation of needle roller gage  $-2/-4$  mm

The actual finished diameter is between 1.498 and 1.496 mm.

In the marking of the needle roller gage, P identifies zero (0) or plus (+), M identifies minus (-). If a shipment of needle rollers of the same size comprises several boxes, each box contains needle rollers of the same grade. The gage may vary from box to box. Each individual box, however, contains needle rollers of identical gage.

|                               |                                                                | low                        | -3 | -4.5             | -6  | -7.5 | -9  | -10 |    |     |     |             |
| 5                             | 5                                                              | high                       | 0  | -3               | -5  | -8   | -10 | 2.5 |    |     |     |             |
|                               |                                                                | low                        | -5 | -8               | -10 |      |     |     |    |     |     |             |

Note 1 - Tolerance values apply only at the middle of the needle roller length.

Note 2 - Needle rollers of any nominal dimensions and any of the quoted grades will be supplied sub-divided into the gages listed in Table 2 at our option, if nothing to the contrary is agreed upon at the time of ordering.

## END FORM TOLERANCES

Table 3 specifies the applicable end configuration for rounded end and flat end needle rollers of all grades.

TABLE 3 –  
END CONFIGURATION LIMITS FOR METRIC NEEDLE ROLLERS

| Rounded End<br>Needle Rollers<br>End Radius |                | Nominal<br>Diameter<br>of Needle<br>Roller |     | Flat End Needle Rollers<br>Chamfer Dimension Limits<br>(Dimensions in millimeters) |                    |       |

| 18                                | 30 | 0                                | -0.33 |
| 30                                | 50 | 0                                | -0.39 |

## DESIGN CALCULATIONS FOR NEEDLE ROLLER BEARING COMPLEMENTS

In the majority of full complement needle roller applications, needle roller complements of less than 35 needle rollers per row and a ratio of length to diameter between 4:1 and 8:1 is advantageous. Other combinations of quantity and length to diameter ratios of needle rollers have been used successfully. Specific design requirements usually dictate the appropriate selection.

In general, needle roller complements for rotating motion should employ a smaller number of large diameter needle rollers, while needle roller complements subjected to oscillating motion (especially under high loads) should employ a large number of smaller diameter needle rollers.

Oscillating applications with small angular travel encourage the development of fretting corrosion. The best performance under these conditions has been achieved by using the largest practical number of small diameter needle rollers.

## CALCULATION OF RACEWAY DIAMETERS

The calculation of inner and outer raceway diameters may be carried out using either the formula given in Table 5 or more conveniently the raceway calculation form in Table 6. To assist the designer in making these calculations, the values of K required for calculation of needle roller complements of 6 through 60 needle rollers are listed in Table 7. Values of K for other numbers of needle rollers can be calculated using the formulas given in Table 5.

Table 8 lists the suggested values for minimum radial internal clearance (G<sub>r</sub> min) and the minimum circumferential clearance divided by π (cc min/π), to be used for calculating needle roller complements for normal rotating applications where the speeds, loads and shaft deflections are moderate.

Applications with poor lubrication, unusual motion, large misalignment, raceway distortions, load reversals, high speeds, etc. can not be characterized as normal rotating applications. These miscellaneous applications require adjustment of the minimum clearances listed in Table 8. The factors in Table 9 may be used for general guidance in the adjustment of the minimal clearances. For any of the listed miscellaneous applications or any application where abnormal factors such as those listed above exist, and particularly when the inner raceway diameter will exceed 50 mm, consult your Timken representative for design assistance.

TABLE 5 – DESIGN FACTORS FOR NEEDLE ROLLERS

|          |                                                                                                                                                                                                                                                                       |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Z        | number of needle rollers per bearing path                                                                                                                                                                                                                             |
| K        | chordal factor, $K = 1/\sin(180^\circ/Z)$                                                                                                                                                                                                                             |
| cc       | total circumferential clearance. See Tables 8 and 9 for $cc_{min}/\pi$ values.                                                                                                                                                                                        |
| $G_r$    | radial internal clearance. See Tables 8 and 9 for $G_{r min}$ values                                                                                                                                                                                                  |
| $D_{pw}$ | pitch diameter:<br>$D_{pw} = K \cdot D_{w max} + (cc_{min}/\pi) = E_{min} - D_{w max}$ $= F_{max} + G_{r min} + D_{w max}$                                                                                                                                            |
| E        | outer raceway bore diameter:<br>$E_{min} = D_{pw} + D_{w max} = (K + 1) \cdot D_{w max} + (cc_{min}/\pi)$ $= F_{max} + G_{r min} + 2D_{w max}$                                                                                                                        |
| F        | inner raceway diameter:<br>$F_{max} = D_{pw} - D_{w max} - G_{r min}$ $= (K-1) \cdot D_{w max} + (cc_{min}/\pi) - G_{r min}$ $= E_{min} - 2D_{w max} - G_{r min}$                                                                                                     |
| $D_w$    | nominal needle roller diameter                                                                                                                                                                                                                                        |
| $D_{we}$ | needle roller diameter applicable in the calculation of load ratings:<br>$D_{we} = D_{pw} - F_{max} - G_{r min} = \frac{D_{pw} - cc_{min}/\pi}{K}$ $= \frac{F_{max} + G_{r min} - (cc_{min}/\pi)}{(K-1)}$ $= E_{min} - D_{pw} = \frac{E_{min} - cc_{min}/\pi}{(K+1)}$ |
| $L_w$    | overall needle roller length                                                                                                                                                                                                                                          |
| $R_w$    | end radius, rounded end needle roller                                                                                                                                                                                                                                 |
| $r_s$    | corner rounding, flat end needle roller                                                                                                                                                                                                                               |
| $L_{we}$ | needle roller length applicable in the calculation of load ratings, for rounded end needle rollers:<br>$L_{we} = L_{w max} - (L_{w max} - \sqrt{L_{w max}^2 - D_{we}^2})$<br>for flat end needle rollers:<br>$L_{we} = L_{w max} - (2 \cdot r_s min)$                 |

Note: If length of contact of the needle roller with the raceway is reduced because of undercuts, chamfers, etc.  $L_{we}$  must be reduced correspondingly.

## RACEWAY DIAMETER TOLERANCES

Table 10 lists the recommended tolerances that should be applied to the dimensions for the maximum inner raceway and minimum outer raceway diameter after they have been calculated using the information given in Table 5 or Table 6.

TABLE 6 – RACEWAY CALCULATION FORM

| STEP | SOURCE    | DESIGN FACTOR                  | MILLIMETERS            |

| 9    | (7) - (8) | F, inner raceway diameter      | 25712 max. 25703 min.* |
| 10   | (5) + (6) | E, outer raceway diameter      | 31725 min. 31741 max.* |

\*From Table 10

## CLEARANCES IN NEEDLE ROLLER COMPLEMENTS

Needle rollers, supplied in bulk, are generally used for full complement assemblies. Successful operation of a full complement of needle rollers not only requires careful selection of radial internal clearance but, more importantly, depends on proper circumferential clearance, or the total clearance between needle rollers.

Needle roller guidance in a full complement assembly depends largely on contact between needle rollers. Too little circumferential clearance causes overheating. Too much circumferential clearance in a heavily loaded full complement of needle rollers causes loss of needle roller guidance and results in needle roller skew and resultant end thrusting.

Control of radial clearance and circumferential clearance is influenced by the needle roller diameter tolerance, as well as the tolerances of the inner and outer raceway diameters.

## END CLEARANCE

The total needle roller end clearance, or end play, normally should be 0.20 mm minimum per path of needle rollers.

TABLE 7

| K VALUES |         |    |         |    |          |
|----------|---------|----|---------|----|----------|

## LOAD RATING AND LIFE CALCULATIONS FOR FULL COMPLEMENTS OF NEEDLE ROLLERS

Before selecting the quantity and size of needle rollers to be used in a needle roller complement, it is usually necessary to calculate the load rating required using the applied load, speed and desired life. For a review of bearing size selection, see the engineering section.

Since it is not practical to tabulate the dynamic and static load ratings for the great number of needle roller complements that can be assembled by using different quantities, diameters and lengths of rollers, formulae are provided for the necessary calculations.

For convenience, values of  $f_c$  and values of  $Z^{3/4}$  have been combined into single factors ( $f_c \cdot Z^{3/4}$ ). These factors for a wide range of roller complements are tabulated in Table 11.

### BASIC DYNAMIC LOAD RATINGS

The basic dynamic load rating C, for any roller bearing can be calculated from the formula:

$$C = f_c \cdot (i \cdot L_{we} \cdot \cos \alpha)^{7/9} \cdot Z^{3/4} \cdot D_{we}^{29/27}$$

where:  $f_c$  = a factor which depends on the geometry of the bearing components, the accuracy to which the various components are made, and the material. Maximum values are listed in such standards as ISO 281 and USA ANSI-ABMA Standard 11.

$i$  = number of rows of rollers in any one bearing.

$\alpha$  = nominal angle of contact. Since  $\alpha = 0$  for a radial roller bearing,  $\cos \alpha = 1$ .

Other symbols are explained in Table 5.

For single path radial roller bearings, where  $i = 1$  and  $\cos \alpha = 1$ , the basic dynamic load rating formula can be written as:

$$C = f_c \cdot Z^{3/4} \cdot L_{we}^{7/9} \cdot D_{we}^{29/27}$$

TABLE 11 – VALUES OF  $f_c Z^{3/4}$  FOR METRIC UNITS

| 50 | 1.604                       |
| 51 | 1.621                       |
| 52 | 1.639                       |
| 53 | 1.656                       |
| 54 | 1.673                       |
| 55 | 1.690                       |
| 56 | 1.707                       |
| 57 | 1.724                       |
| 58 | 1.740                       |
| 59 | 1.757                       |
| 60 | 1.773                       |

**Example:**

Calculate the basic dynamic load rating for a full complement of 28 flat end rollers, 3 mm diameter and 17.8 mm length.

$$C = f_c \cdot Z^{3/4} \cdot L_{we}^{7/9} \cdot D_{we}^{29/27}$$

$$f_c Z^{3/4} \text{ from Table 11} = 1145$$

$$D_{we}^{29/27} = 3^{29/27} = 3,254$$

$$L_{we} = 17.8 - 0.2 = 17.6 \text{ mm}$$

$$L_{we}^{7/9} = 17.6^{7/9} = 9305$$

$$C = 1145 \cdot 9305 \cdot 3254 = 34.7 \text{ kN}$$

When a couple load (overturning moment) is imposed on a single row of needle rollers, the resulting uneven distribution of load can seriously affect bearing life. In such cases, two rows of needle rollers are generally suggested.

**BASIC STATIC LOAD RATING**

The basic static load rating ( $C_0$ ) for any roller bearing, including needle roller bearings, can be calculated from the following formula included in ISO 76, USA ANSI-ABMA Standard 11, and other Standards:

$$C_0 = f_0 \cdot \left(1 - \frac{D_{we} \cdot \cos \alpha}{D_{pw}}\right) \cdot i \cdot Z \cdot L_{we} \cdot D_{we} \cdot \cos \alpha$$

where:  $f_0 = 0,044$  when kilo-newton and millimeter units are used.

$D_{pw}$  = pitch diameter of the needle roller complement (mm).

$i$  = number of rows of rollers in any one bearing.

$\alpha$  = nominal angle of contact. Since  $\alpha = 0$  for radial roller bearing,  $\cos \alpha = 1$ .

The other symbols are described in Table 5.

## NEEDLE ROLLERS – INCH SERIES

## INTRODUCTION

Before selecting a specific needle roller complement, the engineering section of this catalog should be reviewed for detailed information concerning:

- bearing type selection
- bearing life and reliability
- definition of load ratings
- life and load relationships
- effect of raceway hardness
- example of life calculation
- lubrication
- shaft design
- housing design

In addition to these general considerations, material which follows should also be reviewed when selecting a needle roller complement.

Standard inch series needle rollers are furnished in two styles – elliptical end or the most economical design: flat end. Materials, dimensions and tolerances for standard needle rollers are specified in this section.

When required, needle rollers having spherical ends, conical ends, trunnion ends or crank pin ends, as well as other end designs, can be furnished. Your Timken representative should be consulted before final needle roller selection is made.

## INCH SERIES – NEEDLE ROLLER DIMENSIONS

Needle rollers are made from rolling bearing quality steel hardened to 60-64 HRC or equivalent. Nominally inch needle rollers are given in Table 1. Your Timken representative should be consulted for availability. The symbols used in Tables 1 as well as in subsequent tables and figures are summarized in Table 2.

Needle rollers with elliptical ends permit the use of a more generous fillet between the raceway and the locating shoulder than possible with flat end rollers. Also, due to the length of the elliptical end, the possibility of the roller's cylindrical surface operating over the edge of the raceway is less, thus reducing the chance of occurrence of harmful stress concentrations. On the other hand, where design considerations permit their use, flat end rollers achieve the maximum possible effective contact length between roller and raceway along with maximum load ratings and longer life.

## CLEARANCES IN NEEDLE ROLLER COMPLEMENTS

Needle rollers, supplied in bulk, are generally used to assemble full complement bearings. Successful operation of a full complement of rollers not only requires careful selection of radial clearance but, more importantly, depends on proper circumferential clearance, or the total clearance between rollers.

Circumferential guidance in a full complement of needle rollers depends largely on roller-to-roller contact. Too little circumferential clearance causes overheating. Too much circumferential clearance in a heavily loaded full complement of needle rollers causes loss of roller guidance and results in roller skew and heavy end thrust.

Control of radial clearance and circumferential clearance is influenced by the roller diameter tolerance, as well as the tolerances of the inner and outer raceway diameters.

## END CLEARANCE

The total needle roller end clearance, or end play, normally should be 0.008 inch minimum per path of needle rollers.

## NOMINAL INCH NEEDLE ROLLERS TOLERANCES

Unless otherwise specified, inch needle rollers are normally manufactured with a tolerance of +0.0000 in. -0.0002 in. This tolerance has proven acceptable and ensures satisfactory control of circumferential clearance. The needle roller length tolerance may vary with the end configuration. The normal roller length tolerance for rounded end rollers is +0.000 in. -0.020 in.

Timken also manufactures needle rollers with 0.0001 in. diameter tolerance. These offer enhanced load carrying capability and improved control of circumferential clearance. For needle rollers of greater precision, please consult with your Timken representative.

Nominal dimensions for typical inch series needle rollers are shown in Table 1. Timken supplies rollers with smaller and larger length-to-diameter ratios for special applications. Rollers with dimensions other than those shown in Table 1 can be obtained provided the quantities permit economical production. For example, although the largest needle rollers shown in Table 1 are 0.2500 in. (the usual limits for needle rollers), Timken produces quantities of rollers as large as 0.6250 in. diameter.

Your Timken representative should be contacted with the following information about the required needle rollers:

- nominal metric or inch
- diameter and tolerance (e.g., .1250 in., + 0 in. -.0002 in.)
- length and tolerance (e.g., .560 in., + 0 in. -.020 in.)
- end form (e.g., elliptical end or flat end)
- material (e.g., high carbon chrome steel)
- special features required (e.g., Controlled Stress)
- quantity required

# NEEDLE ROLLER BEARINGS

\* Indicates preferred needle roller sizes. Consult with your Timken representative.

## DESIGN CALCULATIONS FOR NEEDLE ROLLER BEARING COMPLEMENTS

In the majority of full complement needle roller applications, roller complements of less than 35 needle rollers per row and a ratio of roller length to roller diameter between 4:1 and 8:1 is advantageous. Other combinations of quantity and length-to-diameter ratios of needle rollers have been used successfully. Specific design requirements usually dictate the appropriate selection.

In general, roller complements for rotating motion should employ a smaller number of larger diameter needle rollers, while roller complements subjected to oscillating motion (especially under high loads) should employ a larger number of smaller diameter needle rollers.

Oscillating applications with small angular travel encourage the development of fretting corrosion. The best performance under these conditions has been achieved by using the largest practical number of small diameter needle rollers.

## CALCULATION OF RACEWAY DIAMETERS

It may be convenient to use the Bearing Calculation Form in Table 3 to calculate the maximum inner raceway and the minimum outer raceway diameters of a bearing. The formula given in Table 2 can also be used. To assist the designer in making these calculations, the values of K required for calculation of needle roller complements of 6 through 60 needle rollers are listed in Table 4. Values of K for other numbers of needle rollers will be furnished on request, or can be calculated from the formula given in Table 2.

Table 5 lists the suggested values for minimum radial clearance and (G<sub>r min</sub>) minimum circumferential clearance divided by π (cc<sub>min</sub>/π), to be used for calculating needle roller complements for normal rotating applications where the speeds, loads and shaft deflections are moderate.

Applications with poor lubrication, unusual motion, large misalignment, raceway distortions, load reversals, high speeds, etc., can not be characterized as normal rotating applications. These miscellaneous applications require adjustment of the minimum clearances listed in Table 5. The factors in Table 6 may be used for general guidance in the adjustment of the minimal clearances. For any of the listed miscellaneous applications or any application where abnormal factors such as those listed above exist, and particularly when the inner raceway diameter will exceed 2 inches, your Timken representative should be consulted for design assistance.

|                 |                                                                                                                                                                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Z               | number of needle rollers per bearing path                                                                                                                                                                                                                                            |
| K               | chordal factor, $K = 1/\sin(180^\circ/Z)$                                                                                                                                                                                                                                            |
| cc              | total circumferential clearance. See Tables 8 and 9 for cc <sub>min</sub> /π values.                                                                                                                                                                                                 |
| G <sub>r</sub>  | radial internal clearance. See Tables 8 and 9 for G <sub>r min</sub> values                                                                                                                                                                                                          |
| D <sub>pw</sub> | pitch diameter:<br>$D_{pw} = K \cdot D_{w \max} + (cc_{\min}/\pi) = E_{\min} - D_{w \max}$<br>$= F_{\max} + G_{r \min} + D_{w \max}$                                                                                                                                                 |
| E               | outer raceway bore diameter:<br>$E_{\min} = D_{pw} + D_{w \max} = (K + 1) \cdot D_{w \max} + (cc_{\min}/\pi)$<br>$= F_{\max} + G_{r \min} + 2D_{w \max}$                                                                                                                             |
| F               | inner raceway diameter:<br>$F_{\max} = D_{pw} - D_{w \max} - G_{r \min}$<br>$= (K-1) \cdot D_{w \max} + (cc_{\min}/\pi) - G_{r \min}$<br>$= E_{\min} - 2D_{w \max} - G_{r \min}$                                                                                                     |
| D <sub>w</sub>  | nominal needle roller diameter                                                                                                                                                                                                                                                       |
| D <sub>we</sub> | needle roller diameter applicable in the calculation of load ratings:<br>$D_{we} = D_{pw} - F_{\max} - G_{r \min} = \frac{D_{pw} - cc_{\min}/\pi}{K}$<br>$= \frac{F_{\max} + G_{r \min} - (cc_{\min}/\pi)}{(K-1)}$<br>$= E_{\min} - D_{pw} = \frac{E_{\min} - cc_{\min}/\pi}{(K+1)}$ |
| L <sub>w</sub>  | overall needle roller length                                                                                                                                                                                                                                                         |
| R <sub>w</sub>  | end radius, rounded end needle roller                                                                                                                                                                                                                                                |
| r <sub>s</sub>  | corner rounding, flat end needle roller                                                                                                                                                                                                                                              |
| L <sub>we</sub> | needle roller length applicable in the calculation of load ratings, for elliptical end needle rollers:<br>$L_{we} = L_{w \max} - (0.4 \cdot D_{we})$<br>for flat end needle rollers:<br>$L_{we} = L_{w \max} - (2 \cdot r_{s \min})$                                                 |

Note: If length of contact of the needle roller with the raceway is reduced because of undercuts, chamfers, etc. L<sub>we</sub> must be reduced correspondingly.

### RACEWAY DIAMETER TOLERANCE LIMITS

Table 7 lists the suggested tolerances that should be applied to the dimensions for the maximum inner raceway and the minimum outer raceway diameter after they have been calculated using the Bearing Calculation Form, Table 3.

TABLE 3 – BEARING CALCULATION FORM

| Step | Source    | Design Factor             | Inch               |                     |
|------|-----------|---------------------------|--------------------|---------------------|
| 1    | given     | $D_{w,roller}$ diameter   | <b>0.1250</b> max. | min.                |
| 2    | Table 4   | K, for 30 rollers         | <b>9.56677</b>     |                     |
| 3    | (1) x (2) | $KD_w$                    | <b>1.1958</b>      |                     |
| 4    | Table 5   | $cc_{min}/\pi = 0.001^*$  | <b>0.0010</b> min. | max.                |
| 5    | (3) + (4) | $D_{pw}$ pitch diameter   | <b>1.1968</b>      |                     |
| 6    | given     | $D_{w,roller}$ diameter   | <b>0.1250</b> max. | min.                |
| 7    | (5) – (6) |                           | <b>1.0718</b>      |                     |
| 8    | Table 5   | $G_r$ , radial clearance  | <b>0.0005</b> min. | max.                |
| 9    | (7)– (8)  | F, inner raceway diameter | <b>1.0713</b> max. | <b>1.0709</b> min.* |
| 10   | (5) + (6) | E, outer raceway diameter | <b>1.3218</b> min. | <b>1.3224</b> max.* |

### KEYSTONED ROLLER ASSEMBLIES

Retention of the rollers in the outer raceway by key-stoning can be helpful in assembly operations. The following formula may be used to check the bearing design to be sure that a given number of rollers, Z, will keystone.

$$Y \cdot D_{w \min} > E_{\max} = \text{keystone condition}$$

That is, the product of the keystone constant Y, given below, and the minimum roller diameter  $D_{w \min}$ , must be greater than the maximum outer race bore,  $E_{\max}$ .

Roller complements with 14 or more rollers usually will not keystone unless steps are taken to reduce the circumferential clearance. It is suggested that your Timken representative be consulted when designing a keystone roller complement with 14 or more rollers.

**TABLE 8 – KEYSTONE CONSTANT**

| Z  | Y       | Z  | Y       | Z  | Y       |

### LOAD RATING AND LIFE CALCULATIONS FOR FULL COMPLEMENTS OF NEEDLE ROLLERS

Before selecting the quantity and size of needle rollers to be used in a needle roller complement, it is usually necessary to calculate the load rating required using the applied load, speed and desired life. For a review of bearing size selection, see the engineering section.

Since it is not practical to tabulate the dynamic and static load ratings for the great number of needle roller complements that can be assembled by using different quantities, diameters and lengths of rollers, formulae are provided for the necessary calculations.

For convenience, values of  $f_c$  and values of  $Z^{3/4}$  have been combined into single factors ( $f_c \cdot Z^{3/4}$ ). These factors for a wide range of needle roller complements are contained in Table 9.

### BASIC DYNAMIC LOAD RATINGS

The basic dynamic load rating C, for any roller bearing can be calculated from the formula:

$$C = f_c (i L_w \cos \alpha)^{7/9} Z^{3/4} D_w^{29/27}$$

where:  $f_c$  = a factor which depends on the geometry of the bearing components, the accuracy to which the various components are made, and the material. Maximum values are listed in such standards as ISO 281 and USA ANSI-ABMA Standard 11.

$i$  = number of rows of needle rollers in any one bearing.

$\alpha$  = nominal angle of contact. Since  $\alpha = 0$  for a radial needle roller bearing,  $\cos \alpha = 1$ .

Other symbols are explained in Table 2.

For single path radial needle roller bearings, where  $i = 1$  and  $\cos \alpha = 1$ , the basic dynamic load rating formula can be written as:

$$C_r = f_c Z^{3/4} L_{we}^{7/9} D_w^{29/27}$$

TABLE 9 – VALUES OF  $F_C Z^{3/4}$  FOR INCH UNITS

| Z  | $f_c Z^{3/4}$ lbf - inch units |

| 59 | 157800                         |
| 60 | 159200                         |

**Example:**

Calculate the basic dynamic load rating in lbf for a full complement of 28 elliptical end rollers, 0.1250 in. diameter and 0.750 in. length.

$$C = f_c \cdot Z^{3/4} \cdot L_{we}^{7/9} \cdot D_{we}^{29/27}$$

$$f_c Z^{3/4} \text{ from Table 9} = 102900$$

$$D_{we}^{29/27} = 0.1250^{29/27} = 0.1072$$

$$L_{we} = 0.750 - (0.4 \cdot 0.1250) = 0.700 \text{ (see Table 2)}$$

$$L_{we}^{7/9} = 0.700^{7/9} = 0.758$$

$$C = 102900 \cdot 0.1072 \cdot 0.758 = 8360 \text{ lbf}$$

When a couple load (overturning moment) is imposed on a single row of needle rollers, the resulting uneven distribution of load can seriously affect bearing life. In such cases, two rows of needle rollers are generally suggested.

Your Timken representative should be consulted before a final selection of a needle roller complement is made.

**BASIC STATIC LOAD RATING**

The basic static load rating ( $C_0$ ) for any roller bearing, including needle roller bearings, can be calculated from the following formula included in ISO 76, USA ANSI-ABMA Standard 11 and other Standards:

$$C_0 = f_0 \cdot \left(1 - \frac{D_{we} \cdot \cos \alpha}{D_{pw}}\right) i Z L_{we} D_{we} \cos \alpha$$

where:  $f_0 = 6430$  when pound-force and inch units are used

$D_{pw}$  = pitch diameter of the needle roller complement (inch).

$i$  = number of rows of rollers in any one bearing.

$\alpha$  = nominal angle of contact. Since  $\alpha = 0$  for radial roller bearing,  $\cos \alpha = 1$ .

The other symbols are described in Table 2.

# NEEDLE ROLLER BEARINGS

## CYLINDRICAL ROLLERS – METRIC SERIES

Timken® Torrington® cylindrical rollers are made from bearing quality steel and hardened to 58-65 HRC or equivalent. Nominal metric cylindrical rollers are sorted into gages based on the mean deviation from nominal diameter and nominal length. The relieved ends of the cylindrical rollers, when used in bearing complements, help to reduce stress concentration at the ends of rollers, both under misalignment or ideal alignment. This results in a more uniform stress distribution along the roller-raceway contact length and optimum bearing performance.

### METRIC SERIES CYLINDRICAL ROLLER DIMENSIONS

Nominally metric cylindrical rollers conforming to **DIN 5402** sheet 1 are shown in Table 1. Chamfer dimension limits of these cylindrical rollers with flat ends are also shown in Table 1. The use of these chamfer limits results in the maximum possible effective contact length between roller and raceway, along with the already mentioned relieved ends, producing the maximum possible load ratings and longer life.

Each cylindrical roller gage is packed separately and the mean deviations of diameter and length gages are shown on the package (below the roller designation).

### EXAMPLE OF METRIC SERIES CYLINDRICAL ROLLER DESIGNATION AND PACKAGE MARKING:

ZRO.6 x 8  
P0/M6

Nominal diameter:  $D_w = 6$  mm

Nominal length:  $L_w = 8$  mm

Mean deviation of the diameter  $\pm 0$   $\mu$ m (see Table 2)

Mean deviation of the length  $-6$   $\mu$ m. (see Table 3)

The actual finished diameter is between 5,999 and 6,001 mm.

The actual finished length is between 7,991 and 7,997 mm.

In the marking of the cylindrical roller gage, P identifies zero (0) or plus (+), M identifies minus (-). If a shipment of cylindrical rollers of the same size comprises several boxes, each box contains cylindrical rollers of the identical gage, although the gage may vary from box to box.

TABLE 1 – DIMENSIONS OF METRIC SERIES CYLINDRICAL ROLLERS

| Nominal Diameter<br>mm | Nominal Length |           |           | Cylindrical Roller Designation | Wt. kg 100 pieces (approx.) |

### INNER RINGS – METRIC SERIES

When it is impractical to meet the shaft raceway design requirements (hardness, surface finish, case depth, etc.) outlined in the engineering section of this catalog, standard inner rings may be used.

Inner rings are made of rolling bearing steel and after hardening, their bores, raceways and end surfaces are ground. Metric series inner rings may be used to provide inner raceway surfaces for metric series needle roller and cage radial assemblies, metric series needle roller bearings and metric series drawn cup needle roller bearings. The extended inner rings are suitable for use with bearings containing lip contact seals and for applications in which axial movement may be present.

#### CONSTRUCTION

Metric series inner rings are available in four basic designs and differ only by the chamfers at the ends of the raceway surfaces, the lubricant access holes and the raceway profile. Inner rings of series JR have chamfers to assist in bearing installation but are without lubricating holes. Inner rings of series JR and IM have bearing installation chamfers and lubricating holes (bore diameters 5 to 50 mm). Inner rings of series JRZ.JS1 are without installation chamfers, allowing for maximum possible raceway contact. IM...RG6 inner rings have a profiled outer diameter for use in applications having a greater degree of misalignment.

The BIC and BICG Series inner rings have chamfers and oil holes and are designed to be used with the full complement, metric, needle roller bearings of Series RNA1000, RNA2000 and RNA3000. These inner rings are intended for RNA bearings of the same number; for example a BIC2020 would be used with a RNA2020.

#### DIMENSIONAL ACCURACY

The tolerances of size, form, and runout for metric series inner rings meet the requirements of ISO normal tolerance class for radial bearings (see the engineering section). Most metric series inner rings are produced with outside diameter raceway tolerance in accordance with h5 which, in most cases, is suitable for combining the metric series needle roller bearings to give the

normal clearance class, and for use with drawn cup bearings. Other raceway tolerances may also be found on inner rings for combining with needle roller bearings to give one of the clearance classes, or other specially requested radial internal clearance requirement.

#### MOUNTING OF INNER RINGS

Inner rings may be mounted on the shaft with either a loose transition fit or an interference fit. These fits used in conjunction with the proper fit of the bearing outer ring, will provide the correct operating clearances for most applications.

Regardless of the fit of the inner ring on the shaft, the inner ring should be axially located by shaft shoulders or other positive means. The shaft shoulder diameter adjacent to the inner ring must not exceed the inner ring outside diameter (per suggestions on page C103 of the metric series needle roller bearing section).

When metric series inner rings are to be used with the metric series needle roller bearings, appropriate shaft tolerances should be selected from Table 3 in the metric series needle roller bearing section. When metric series inner rings are to be used with drawn cup bearings the suggested shaft tolerances are given in the "Inner ring" discussion on page C39 of the "metric series drawn cup needle roller bearings" section of this catalog.

#### INCH SERIES INNER RINGS

Inch series inner rings for use with inch series drawn cup bearings are tabulated on page C92 of this catalog. See catalog page C150 for inch series inner rings for use with inch series needle roller bearings.

#### END WASHERS – METRIC SERIES

When the metric series needle roller and cage radial assembly used in series NAO and RNAO needle roller bearings without flanges cannot be axially located by suitable shoulders or side faces, end washers of series SNSH may be used. These end washers, which are made of spring steel, are designed to be guided in the housing bore. They are tabulated on page C353.

## RADIAL AND ANGULAR CONTACT BEARINGS

**Overview:** Timken is a premier manufacturer of ball bearings. We produce a broad range of precision ball bearings, wide inner ring ball bearings and housed units for standard industrial applications and specialized uses. From standard single-row deep groove radial ball bearings to advanced integral designs, Timken has your solution.

- **Sizes:** 3 mm - 600 mm bore.
- **Markets:** Aircraft, construction, agriculture, machine tool and general industry.
- **Features:** Special coatings for corrosion resistance, special seal designs.
- **Benefits:** Radial: Better life in contaminated environments.

Angular: Single-row angular contact ball bearing - suited to work in lower operating temperature and high speed with a heavy thrust load. Can be mounted in a duplex arrangement. The refined bore tolerance give a higher life.

Double-row angular contact ball bearing - excellent axial and radial rigidity in confined space.

D

## Radial and Angular Contact Ball Bearings

### Prefixes:

- A** stainless steel
- F** flanged outer ring
- H** snug fit
- J** extra loose internal fit
- JJ** extra extra loose internal fit
- L** internal self-aligning
- M** precision ABEC 3
- P** loose fit
- R** normal fit
- S** extra small inch-dimension type
- T** tight fit
- V** precision ABEC 5
- W** wide-type single-row  
(same width inner and outer)
- WIR** single-row, wide inner only

**Bore Size:** (04 and up: multiply last two numbers by five to get bore in millimeters)

- 00** 10 mm
- 01** 12 mm
- 02** 15 mm
- 03** 17 mm
- 04** 20 mm
- 05** 25 mm
- 12** 60 mm
- 20** 100 mm

### Suffixes:

- C1, C2, C3, etc.** (manufacturing code - Timken® use only)
- FT** full ball complement
- K** Conrad, non-filling slot type
- W** maximum capacity, filling slot type
- WI** angular contact, low-shoulder outer
- WO** angular contact, low-shoulder inner
- WN** angular contact, low-shoulder, inner and outer

**W**

**3**

**05**

**K**

**LL**

### Numbers: Basic Type Series:

- S1** 3, 5, 7, etc., single-row inch, extra small
- 30** single-row metric, extra small
- 100** single-row, extra large
- 200** single-row, light
- 300** single-row, medium
- 5200** double-row, light
- 5300** double-row, medium
- 7200** single-row, angular contact, light
- 7300** single-row, angular contact, medium
- 7400** single-row, angular contact, heavy
- 9100** single-row, extra-light
- 9300** single-row, ultra-light
- XLS** inch-dimension, Conrad type

### Additional Features:

- B** spherical outside diameter
- BR** cast bronze retainer
- D** one shield
- DD** two shields
- G** Wireloc (snap ring)
- L** one Mechani-Seal
- LL** two Mechani-Seals
- MBR** machined bronze retainer
- P** one seal
- PP** two seals
- PP2, 3, 4, etc.** Tri-Ply Seals if prefix letter is W (example: W208PPB5)
- R** one land-riding rubber seal
- RR** two land-riding rubber seals
- S** external self-aligning
- SMBR** iron silicon bronze retainer
- T** one felt seal
- TT** two felt seals

## BALL BEARINGS

### INTRODUCTION

#### EXTRA SMALL SERIES

Extra small bearings are available in the 30 Metric Series, the 33 and S Inch Series and the F Flanged Series. These bearings can sustain radial, thrust and combined loads proportionate to the capacities of the small shafts for which they are designed. They are appropriate for use in fractional horsepower motors, precision instruments, domestic appliances, film projectors and similar devices.

The F flanged series has external shoulders with the bearing for mounting in through-bored housings. This series is used where compactness is essential or where it is not feasible to machine housing shoulders.

All series in the extra small family include shielded versions. The 30 Metric Series is also available with felt seals, Mechani-Seals and rubber seals, while the 33 and S Inch Series is available with rubber seals.

Some sizes in the Extra Small Series are manufactured from stainless steel.

#### EXTRA SMALL 33 AND S SERIES BUSINESS MACHINE BEARINGS

Standard and special extra small bearings are available and often used in business machine applications. They include clamp-type collar bearings for slip-fit mounting on shafts, bearings with Wireloc in the outer ring, and rubber cushioned "O" series with special housed units.

#### EXTRA LIGHT 9300 AND 9100 SERIES

Bearings in the Extra Light 9300 and 9100 Series are ideally suited for applications where housing diameters are restricted and it is desirable to maintain relatively large shaft diameters. Both series are made in the Conrad or non-filling slot construction with the 9300 Series having a somewhat thinner section.

The 9100 Series is generally available with shields, rubber seals and snap ring combinations. The 9300 Series is selectively available with two rubber seals. Machine tools, textile machinery and jet engine gear boxes are some of the end products in which these series have found wide use.

#### LIGHT 200 SERIES

Bearings in the 200 Series have a greater section height than the Extra Light 9300 and 9100 Series bearings and feature a close dimensional balance between bore, outside diameter and width. These characteristics make them well-suited for a broad range of applications involving light to medium loads combined with relatively high speeds.

Their versatility has made them a popular design choice of designers and has resulted in many variations in the series. They are available in either the Conrad or maximum capacity type and with shields, rubber seals, Mechani-Seals, felt seals or a combination of shield and seal. Snap ring combinations are also included.

Wide-type 200 Series rubber seal (W200PP) and Mechani-Seal (W200KLL) bearings are made with standard bores and outside diameters, but in widths equal to the corresponding sizes of double-row bearings. This series offers a larger support area for shaft and housing contact and extra space for lubricant.

#### MEDIUM 300 SERIES

The 300 Series radial ball bearings are similar in construction to the 200 Series, but have considerably heavier cross sections throughout. They provide greater radial and thrust capacity and are able to withstand heavier shock loads.

Because of their rugged construction, these bearings are particularly suited for heavy-duty applications like those found in large electric motors, woodworking machinery and gear boxes. This series includes both Conrad and maximum capacity designs as well as shielded, sealed and snap ring variations.

In the 300 Series wide-type, rubber seal (W300PP) and Mechani-Seal (W300KLL) bearings are made with standard bores and outside diameters, but in width equal to the corresponding sizes of double-row bearings.

Extra Small Series

Extra Light 9300 and 9100 Series

Light 200 Series

Medium 300 Series

D

### XLS AND EXTRA LARGE 100 SERIES

Bearings in the inch-dimension XLS Series and metric-dimension Extra Large 100 Series have extra large diameters and a compact cross section. XLS bearings are made in the Conrad and maximum capacity filling slot designs. The Extra Large 100 Series offers the maximum capacity, filling slot and counterbore types.

XLS and Extra Large 100 Series

### TRI-PLY SEAL DISK HARROW BEARINGS

Bearings with Tri-Ply Seals are designed for service involving severe contamination, such as disk harrows, disk tillers and other seed preparation equipment and certain conveyor applications. Tri-Ply sealed units come in two designs – one consisting of three Timken rubber seals separated by steel spacers and retained by steel caps in the outer ring and the other, a highly effective one-piece, molded seal design. Both designs have an exterior shroud cap to protect the seals and reinforce the exceptional sealing action of the complete unit. A patented notched seal groove design, provided on selected sizes, is one of the most positive seal retention methods ever developed.

Tri-Ply Seal Disk Harrow Bearings

### HEX BORE BEARINGS

These bearings are designed for either outer or inner ring rotation in low speed, moderately loaded applications such as farm machinery and conveyors. Their chief advantage is ease of mounting. Except for axial positioning by adjacent parts, no collars, setscrews or other external parts are required to lock the inner ring to the hex shaft.

Hex Bore Bearings

### R-SEAL DISK HARROW BEARINGS

R-Seal bearings are designed for a wide variety of farm machinery applications where single-lip positive contact seals are required. Each sealing element has a Timken Fafnir rubber seal that effectively seals the bearing with a heavy flare on the cylindrically ground O.D. (inner ring). A steel back-up plate supports the seal rubber and prevents the seal lip from inverting. An outside metal shroud cap gives maximum abrasion protection to the rubber element and completes the assembly that is rolled into the outer ring seal groove for positive retention.

R-Seal radial ball bearings are used in positions in planting, cultivating and harvesting machinery. They are available in various configurations including round bores in metric and inch dimensions and cylindrical and spherical outside diameters.

R-Seal Agricultural Bearings

### ANGULAR CONTACT – SINGLE-ROW 7000 PRODUCT FAMILY

Timken offers a 7200WN Light, 7300WN Medium and 7400WN Heavy Series single-row, angular contact bearings, which are designed for combination loading with high-thrust capacity in one direction.

The 7000WN bearings are manufactured with better than ABEC 1 inner ring bore tolerances and ABEC 3 running accuracy. These bearings, when mounted in a duplex arrangement, provide axial and/or radial rigidity in applications where control of shaft displacement is essential.

These bearings are available with various cage designs as defined in the dimension tables. The external dimensions of all 7000WN bearings interchange with corresponding sizes in the 200, 300 and 400 single-row radial series.

Single-Row Angular Contact Bearings 7000 Product Family

### ANGULAR CONTACT – DOUBLE-ROW

Double-row Angular Contact Bearings are available in the Light 5200 and Medium 5300 Series. These bearings have the same bores and outside diameters as the corresponding sizes in the 200 and 300 Series, single-row, radial type.

Chief advantages of the double-row type are rigidity, compactness and high capacity. The two rows of balls provide for bearings large radial capacity combined with moderate thrust capacity in either direction.

Double-row bearings are available in both the Conrad (K) construction with uninterrupted race shoulders and the maximum capacity type. The latter has a filling slot in the shoulder of both rings and a maximum ball complement.

Sizes with the W suffix have the filling slot on one side only. In these cases, thrust should be applied on the side opposite the filling slot.

Double-Row Angular Contact

# BALL BEARINGS

## EXTRA SMALL 30 METRIC SERIES

- Designed for small shafts.
- Can sustain radial, thrust and combined load proportionate to capacities of small shafts.
- Suitable for use in fractional horsepower motors, domestic appliances, precision instruments and similar devices.
- Offer various combinations of shields and seals, as listed below.
- Electric motor quality for applications where quietness is required.
- Stainless steel series, denoted by a prefix A before the bearing number. (Example: A38K)

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.

<sup>(2)</sup> Based on 10<sup>6</sup> revolutions of calculated fatigue life.

EXTRA SMALL 30 METRIC SERIES

MECHANI-SEALS

- Developed by The Timken® Company.
- Adapted to the 30 metric series for effective grease retention and exclusion of foreign matter.
- Can be operated at speeds comparable to open-type bearings.
- Available with:
  - One Mechani-Seal (suffix L).
  - One Mechani-Seal and one shield (suffix LD).
  - Two Mechani-Seals (suffix LL).

(1) Maximum shaft or housing fillet radius that bearing corners will clear.

(2) Does not apply to bearings with two seals.

Note: Inner ring offset is .51 mm (.020 inches) for the L, LD, and VLD versions.

(3) Two seals (suffix LL) type only.

(4) Based on 10<sup>6</sup> revolutions of calculated fatigue life.

FELT-SEALS

- Provide effective barrier against the entrance of foreign matter and the escape of lubricant.
- Contact seal with the felt riding on the ground surface of inner ring O.D.
- Can be operated at moderate speeds without excessive heating because the felt washer absorbs some lubricant.
- Electric motor quality where quietness is required.
- Available with:
  - One felt seal (suffix T).
  - One felt seal and one shield (suffix TD).
  - Two felt seals (suffix TT).

(1) Maximum shaft or housing fillet radius that bearing corners will clear.

(2) Does not apply to bearings with two seals.

(3) Based on 10<sup>6</sup> revolutions of calculated fatigue life.

# BALL BEARINGS

## EXTRA SMALL 33 AND S INCH SERIES

- Designed for small shafts.
- Can sustain radial, thrust and combined loads, proportionate to capacities of small shafts.
- Suitable for use in fractional horsepower motors, domestic appliances, precision instruments and similar devices.
- Include combinations of shields and seals, as listed below.
- Electric motor quality for applications where quietness is required.
- Several sizes are manufactured both in standard bearing-quality steel and stainless steel, as indicated in the tables.

### DIMENSIONS – TOLERANCES

## FLANGED SERIES

### CYLINDRICAL O.D.

- Four sizes offered in flanged construction.
- Integral shoulders for mounting in through-bored housings.
- Straight outside diameters.
- Interchangeable with corresponding unflanged sizes.
- Available with double shields.
- Electric motor quality for applications where quietness is required.

<sup>(1)</sup> Also available in stainless steel. To specify, add prefix "A" before bearing number.

<sup>(2)</sup> Based on 10<sup>6</sup> revolutions of calculated fatigue life.

\* Also available with two contact seals. To specify, replace "KDD" in part number with "PP".

### TAPERED O.D.

- F Flanged series has shoulders integral with the bearings for mounting in through-bored housings.
- Used where compactness is essential or where it is not desirable to machine housing shoulders.
- All sizes in series have tapered outside diameters and are available with double shields.
- Suitable applications include precision instruments, packaging machinery and motion picture projectors.
- Several sizes in the series are manufactured in both standard bearing-quality, chromium-alloy, high-carbon steel and stainless steel (stainless steel specified by suffix "A").
- Electric motor quality where quietness is required.

<sup>(1)</sup> Full type, no retainer. Not suggested for speeds over 500 RPM.

<sup>(2)</sup> H dimension is 9.68 mm (.381") for F5DD.

<sup>(3)</sup> Land dimension of the inner ring.

<sup>(4)</sup> Based on 10<sup>6</sup> revolutions of calculated fatigue life.

# BALL BEARINGS

## ST FLANGETTE UNIT

- Pressed steel housed units designed for light-duty applications.
- Available in shaft sizes from 6.35 mm - 12.7 mm (1/4 to 1/2 inch).
- Designed to simplify mounting on side plate or frame-type housings.
- Two identical steel stampings house a clamp-type bearing with a spherical O.D. outer ring.
- Spherical inside surface of each stamping mates with the spherical O.D. of the bearing, providing initial self-alignment at mounting.
- Offers features of basic clamp-type bearing.
- Available with sealed or shielded construction.
- Radial load capacity is 25 percent of basic bearing's dynamic load rating at 33.3 RPM.
- Inspected to ABEC-1 tolerances, except bore.
- Suggested shaft tolerance: Nominal bore size to -.0005 in. resulting in .000 in. to .001 in. loose-shaft fit.

\* All setscrews are hex socket oval point, six fluted socket setscrews available upon request. Setscrews with fused plastic patch available at added cost.

\*\*Bore tolerance applies prior to collar assembly.

## RTF-RUBBER TIRE FLANGE HOUSED UNIT

- Synthetic, conductive elastomer of Durometer hardness 80-85 facilitates mounting of standard cylindrical O.D. bearings in side plate of frame-type housings.
- Generous taper on entrance corner of rubber cartridge simplifies insertion of unit into side panel, assuring reasonable squareness of bearings when fully mounted.
- Bearing is positioned by integral flange of the rubber cartridge.
- Resiliency of elastomer accommodates wider than the standard suggested housing bore tolerance.
- Greater flexibility in adjusting to minor shaft and/or housing alignment.
- Helps reduce airborne noise and structural vibration.
- Additional advantages are similar to features of basic clamp-type bearing design.
- Due to deflection characteristics of the elastomer, radial and thrust ratings for the RTF Series are 10 percent of the basic bearing's dynamic load rating at 33.3 RPM.

\* All setscrews are hex socket oval point, six fluted socket setscrews available upon request. Setscrews with fused plastic patch available at added cost.

\*\*Bore tolerance applies prior to collar assembly.

## SPECIAL BEARINGS

- Pulley, guide roller and pinch roll bearings:
  - Available in several bore sizes.
  - Lightweight, low inertia, low torque and accurate running characteristics with minimum runout and wobble.
  - Many units feature outer ring assemblies with integral molded tires.
  - Most common tire materials are aluminum, steel and a variety of engineered plastics such as nylon, polycarbonate, acetal resin or polyurethane.
  - Tire material and configuration are determined by application requirements.
  - Standard materials and shapes can be made in many sizes.
  - Timken engineering may assist in testing materials you feel are suitable for your applications.
  
- Timken universal ring design:
  - Sealed or shielded versions readily available in the most basic bearing sizes.
  - Varying degrees of seal drag, to suit the sealing torque requirements dictated by the environmental conditions of the application.
  
- Integral assembly design concept:
  - Complete package of bearings, housings, shafts, etc.
  - Assembled and ready to mount.
  - Custom designed to solve customer assembly problems and minimize inventory of multiple components.
  - Overall cost savings.
  - Bearing units shown have been developed especially for business machine applications.

D

# BALL BEARINGS

## ULTRA LIGHT 9300K SERIES

- Designed for applications where housing diameters are restricted and it is desirable to maintain relatively large shaft diameters.
- Resembles the 9100K Series, except corresponding sizes of the 9300K Series have a somewhat thinner section.
- Used extensively in machine tools, textile machinery and jet engine gearbox applications.

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.

\* Width tolerance is +.00 mm to -.15 mm (+.000" to -.006").

<sup>(2)</sup> Also available with rubber seals, e.g., 9303PP.

<sup>(3)</sup> Also available with two shields, e.g., 9306KDD.

<sup>(4)</sup> Based on 10<sup>6</sup> revolutions of calculated fatigue life.

## EXTRA LIGHT 9100K SERIES

- For applications where housing diameters are restricted and it is desirable to maintain relatively large shaft diameters.
- Electric motor quality for applications where quietness is a requirement.

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.

<sup>(2)</sup> Based on 10<sup>6</sup> revolutions of calculated fatigue life.

<sup>(1)</sup> The snap ring is normally packaged separately in the box with bearing.

<sup>(2)</sup> Width of bearing is 12.700 mm (.5000").

# BALL BEARINGS

## LIGHT 200K SERIES

- Conrad-type bearing is well-balanced, with deep races and uninterrupted race shoulders. Excellent, general-purpose bearing.
- Capacity to carry radial and thrust in either direction or combined loads.
- Electric motor quality for applications where quietness is a requirement.

### DIMENSIONS – TOLERANCES

<sup>(1)</sup> The snap ring is normally packaged separately in the box with the bearing.

<sup>(2)</sup> Available with snap ring as 200PDG.

<sup>(3)</sup> Also available in "VV" sealed design. Check for availability.

**Note:** "N" prefix for NP(P) seals indicate non-removable seal.

# BALL BEARINGS

## LIGHT 200W SERIES

- 200W Series, maximum capacity type, is dimensionally interchangeable with the 200K type, but has greater capacity for supporting heavier radial loads and light thrust loads in either direction.
- Maximum capacity bearings feature a filling slot in shoulder of each raceway to assemble an extra-large complement of balls.
- Consult your Timken representative for the availability of sizes other than those listed here.

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.

<sup>(2)</sup> These sizes have molded nylon cages.

<sup>(3)</sup> Based on 10<sup>6</sup> revolutions of calculated fatigue life.

\* For applications where thrust load exceeds 60% of radial load, consult your Timken representative.

## Radial and Angular Contact Ball Bearings

Listed in the table below are Timken maximum capacity type bearings (200W Series) with shields, seals and snap ring combinations.

The suffixes of the bearing numbers denote the following:

- **WD** - Filling slot opposite single shield
- **WNP** - Filling slot opposite single seal
- **WG** - Filling slot opposite snap ring
- **WDD** - Two shields
- **WNPP** - Two seals
- **WDG** - Filling slot and snap ring opposite shield
- **WDDG** - Two shields with filling slot opposite snap ring

<sup>(1)</sup> The snap ring is normally packaged separately in the box with the bearing.

<sup>(2)</sup> Also available as a GWD-type filling slot opposite the shield and snap ring.

<sup>(3)</sup> Also available as 211GW with filling slot on same side as snap ring.

<sup>(4)</sup> Width is 1.6535" for the 224WD bearing.

# BALL BEARINGS

## LIGHT 200 SERIES EXTRA WIDTH INNER RING

- Sizes available in rubber seal (P) and Mechani-Seal (L) design.
- Extra width inner ring provides greater shaft support.
- P seal version uses a Buna N rubber contact seal.
- L seal employs a frictionless metallic member to form a labyrinth.
- Used extensively in high-speed pneumatic tools, small pumps, electric motors, domestic appliances, etc.
- Electric motor quality for applications where quietness is a requirement.

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.

<sup>(2)</sup> Also available as 203KLL with 18.24 mm (.718") inner ring width.

<sup>(3)</sup> Also available as 205KLL with 20.64 mm (.812") inner ring width.

<sup>(4)</sup> Equipped with R-Seal.

<sup>(5)</sup> Based on 10<sup>6</sup> revolutions of calculated fatigue life.

<sup>(1)</sup> The snap ring is normally packaged separately in the box with the bearing.

**NOTE:** "N" prefix indicates a non-removable seal.

# BALL BEARINGS

## LIGHT 200 SERIES FELT SEAL TYPE

- Permits certain design economies, but cannot be assumed to be suitable for all conditions of service.
- In many cases, they are supplemented by adjacent parts in the application for adequate bearing protection in small equipment such as fractional horsepower motors, electric vacuum cleaners, small gear units, electric and pneumatic tools, etc.
- Suggested for effective grease retention and exclusion of foreign matter.
- Electric motor quality for applications where quietness is a requirement.

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.

<sup>(2)</sup> 202KT3 has 12.29 mm (.484") inner ring width.

<sup>(3)</sup> Based on 10<sup>6</sup> revolutions of calculated fatigue life.

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.

<sup>(2)</sup> Based on 10<sup>6</sup> revolutions of calculated fatigue life.

### LIGHT, WIDE TYPE W200PP SERIES W200KLL SERIES

- Rubber seal (W200PP) and Mechani-Seal (W200KLL) types.
- Made with standard bores, standard outside diameters and a single row of balls.
- Same widths as double-row bearings of corresponding size.
- Extra width offers a larger support area for shaft and housing contact and added space for prepacked lubricant.
- Wide-type rubber seal bearings are particularly suited for use in electric motors, where they simplify housing design by eliminating auxiliary seals.
- Wide-type Mechani-Seal ball bearings are designed for applications where frictionless sealing and large grease capacity are required.
- Extremely effective grease retention and exclusion of foreign matter are assured by close running clearance between the seal members and slinger action of the outer member.

#### DIMENSIONS – TOLERANCES

(1) Maximum shaft or housing fillet radius that bearing corners will clear.  
 (2) Also available with snap ring. To order, add suffix "G" to bearing number. Example: W205PPG.  
 (3) The snap ring is normally packaged separately in the box with the bearing.  
 (4) Based on 10<sup>6</sup> revolutions of calculated fatigue life.

# BALL BEARINGS

## MEDIUM 300K SERIES

- A heavier cross section than the 200 Series.
- Capable of carrying considerably heavier radial, thrust and combined loads for a given bore size.
- Capable of withstanding heavy shock loads. A ball bearing of heavier cross section is rarely required.
- Uses Conrad-type bearing that is well-balanced, with deep races and uninterrupted race shoulders.
- Electric motor quality where quietness is a requirement.

### DIMENSIONS – TOLERANCES

<sup>(1)</sup> The snap ring is normally packaged separately in the box with the bearing.  
**Note:** "N" prefix indicates a non-removable seal in NP (P) designs.

# BALL BEARINGS

## MEDIUM 300W SERIES

- A heavier cross section than the 200 Series.
- Capable of carrying considerably heavier radial, thrust and combined loads for a given bore size.
- Capable of withstanding heavy shock loads. A ball bearing of heavier cross section is rarely required.
- 300W Series bearings are dimensionally interchangeable with the 300K Series. However, bearings within the 300W Series are capable of carrying heavier radial loads, due to their larger ball complements.

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.

<sup>(2)</sup> Based on 10<sup>6</sup> revolutions of calculated fatigue life.

For applications where thrust load exceeds 60% Radial Load, consult your Timken representative.

## Radial and Angular Contact Ball Bearings

Listed in the table below are Timken maximum capacity type bearings (300W Series) with shields, seals and snap ring combinations.

The bearing number suffixes denote the following:

- **WD** - filling slot opposite single shield
- **WG** - filling slot opposite snap ring
- **WDD** - two shields
- **WDG** - filling slot and snap ring opposite shield

### SHIELDS, SEALS AND SNAP RING COMBINATIONS

<sup>(1)</sup> The snap ring is normally packaged separately in the box with the bearing.

<sup>(2)</sup> Also available as a GW-Type filling slot and snap ring on same side. Also available 308GW2 with 20 mm width.

<sup>(3)</sup> Also available as 312WG-3 with filling slot on same side as snap ring.

# BALL BEARINGS

## MEDIUM, WIDE TYPE W300PP SERIES AND W300KLL SERIES

- The W300PP (rubber seal) Series and the W300KLL (Mechani-Seal) Series have the same bores and outside diameters as standard 300 Series ball bearings.
- Widths are equal to 5300 Series double-row ball bearings.
- Added width provides extra support on shafts and in housings and eliminates the need for locknuts and lockwashers on applications such as electric motors.
- Prepacked with the right amount of long-life, factory-filtered grease.
- These series incorporate the same advantages as the standard width Mechani-Seal and rubber seal bearings.
- Electric motor quality for applications where quietness is a requirement.

### DIMENSIONS – TOLERANCES

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.  
<sup>(2)</sup> Also available with snap ring. To order, add suffix "G" to bearing number. Example: W305PPG.  
 The snap ring is normally packaged separately in the box with the bearing.  
<sup>(3)</sup> Width tolerance is .00 mm to -.15 mm (.000" to -.006").  
<sup>(4)</sup> Based on 10<sup>6</sup> revolutions of calculated fatigue life.

### TRI-PLY SEAL SERIES NON-RELUBRICATABLE TYPE CYLINDRICAL O.D.

- Designed for environments where severe contamination is present, such as agricultural tillage equipment.
- One-piece Tri-Ply seal:
  - Incorporate a highly effective design molded to an exterior shroud cap.
  - Provide exceptionally effective protection against loss of lubricant and entrance of wet or abrasive contaminants.
- Seven-piece Tri-Ply construction:
  - Standard on certain sizes.
  - Shroud cap nests closely with the outside seal.
  - Helps protect the rubber seal members from fiber wrap warpage and abrasion.
  - Balanced design, identified by deep races, large balls and extra-wide or heavy, shock-resistant inner and outer rings.
- Use of Tri-Ply Seal bearings simplifies housing designs and their extra inner ring width provides greater support on the shaft.
- For speeds in excess of 500 RPM, consult your Timken representative.

<sup>(1)</sup> Inner and outer width tolerance is .00 mm to -.15 mm (.000" to -.006").

<sup>(2)</sup> Based on 10<sup>6</sup> revolutions of calculated fatigue life.

TRI-PLY SEAL SERIES RELUBRICATABLE TYPE

- Similar in design and features to those shown on the preceding two pages.
- Includes a provision for relubrication.

(1) Cylindrical O.D.

(2) Inner and outer width tolerance is .00 mm to -.15 mm (.000" to -.006").

(3) Based on 10<sup>6</sup> revolutions of calculated fatigue life.

# BALL BEARINGS

## TRI-PLY SERIES DISK HARROW UNITS

- The answer to versatility in design.
- For extra-special design needs, this unit incorporates a Tri-Ply bearing mounted in two stampings, riveted together with two o-rings.
- Available in two basic size groups, one incorporating a 209 and the other a 211 bearing.
- Both size groups offer these features:
  - Dynamic alignment capability ( $\pm 3^\circ$ ).
  - Shroud effect from close clearance of stamping to inner ring.
  - Relubrication.
  - One unit piece for ease of handling and assembly.
  - Fitting flange mates with outer ring milled recess, preventing possibility of outer ring circumferential movement.
  - Stampings are case hardened to minimize wear.
  - Units are equipped with nylon retainer, molded one-piece seals and patented notched outer ring seal grooves.

## HEX BORE BEARINGS

- Designed to be used for outer or inner ring rotation in low-speed, moderately-loaded applications, primarily in agricultural implements and conveyors.
- Tolerances of the hex bore are suitable for mounting on cold rolled hex shafting.
- Main advantage is ease of mounting. Except for axial positioning by adjacent parts, no collars, setscrews or other locking devices are required to lock the inner ring to the hex shaft.
- Utilize the R-Type shroud seal.

<sup>(1)</sup> Tri-Ply Seal bearing.

<sup>(2)</sup> Inner and outer ring tolerance is .00 mm to -15 mm (.000" to -.006").

<sup>(3)</sup> Based on 10<sup>6</sup> revolutions of calculated fatigue life.

# BALL BEARINGS

## LIGHT 200 SERIES R-SEAL TYPE

- Consists of deep groove, Conrad-type bearings.
- Incorporates a flare-out, contact R-Seal.
- Synthetic rubber impregnated washer is enclosed between two metal shields, providing excellent protection against contaminants.
- Because of the heavy contact seal, this series is normally employed in moderate-speed service.

<sup>(1)</sup> Maximum shaft or housing fillet radius which bearing corners will clear.

<sup>(2)</sup> Inner and outer width tolerance is .00 mm to -.15 mm (.000" to .0006").

<sup>(3)</sup> Based on 10<sup>6</sup> revolutions of calculated fatigue life.

## FARM RADIAL SPECIALS

### BEARING NUMBER 202NPP9

#### SPECIAL FEATURES

- 1/2 in. Bore
- O.D. corner turned to a 3/4 in. radius
- Special heavy stiff seals of Buna-N rubber
- Crimped-in seal

#### TYPICAL APPLICATIONS

Cam Follower

### BEARING NUMBER 202KRR7

#### SPECIAL FEATURES

- 1/2 in. Bore
- 1 1/2 in. O.D.
- Thick outer ring

#### TYPICAL APPLICATIONS

Cam Follower

Continued on the next page.

**FARM RADIAL SPECIALS** (continued)

**BEARING NUMBER**  
**203KRR3**

**SPECIAL FEATURES**

- 5/8 in. Bore
- 2 in. O.D.
- Thick outer ring

**TYPICAL APPLICATIONS**

Cam Follower  
Guide Rolls for Baler Plunger

**BEARING NUMBER**  
**P204RR6**

**SPECIAL FEATURES**

- 3/4 in. Bore
- 1.7805 in. O.D.
- Replaces 204KRNP2

**TYPICAL APPLICATIONS**

Mower Spindle

**BEARING NUMBER**  
**203KRR6**

**SPECIAL FEATURES**

- 5/8 in. Bore
- 47 mm O.D.
- Thick outer ring

**TYPICAL APPLICATIONS**

Idler Pulley  
Idler Sprocket

**BEARING NUMBER**  
**204RR7**

**SPECIAL FEATURES**

- 3/4 in. Bore
- 1.7805 in. O.D.
- Replaces 204KRNP3

**TYPICAL APPLICATIONS**

Rolling Cultivator  
Disk

**BEARING NUMBER**  
**203NPP9**

**SPECIAL FEATURES**

- 5/8 in. Bore
- Width .500"

**TYPICAL APPLICATIONS**

Disk Grain Drill

**BEARING NUMBER**  
**205KR3**

**SPECIAL FEATURES**

- 3/4 in. Bore
- Excellent moment load capacity available from special internal geometry of races
- Heavy contact flare-out type R-Seal with shroud cap

**TYPICAL APPLICATIONS**

Disk Hiller, Planter

**BEARING NUMBER**  
**204RY2**

**SPECIAL FEATURES**

- 5/8 in. Bore
- Gothic Arch Race

**TYPICAL APPLICATIONS**

Planter  
Double Disk Opener

**BEARING NUMBER**  
**205KP6**

**SPECIAL FEATURES**

- 3/4 in. Bore
- Tri-Ply Seal on one side with shroud cap

**TYPICAL APPLICATIONS**

Rolling Cultivator

# BALL BEARINGS

## FARM RADIAL SPECIALS (continued)

### BEARING NUMBER 205KRR6

#### SPECIAL FEATURES

- 1/2 in. Bore
- Extended inner ring

**TYPICAL APPLICATIONS**  
Potato Harvester

### BEARING NUMBER 208NPPB5

#### SPECIAL FEATURES

- 1 7/16 in. Bore
- PP Seals with shroud cap

**TYPICAL APPLICATIONS**  
Baler Crank Pin

### BEARING NUMBER 206KP2

#### SPECIAL FEATURES

- Tri-Ply Seal on one side with shroud cap

**TYPICAL APPLICATIONS**  
Combine

### BEARING NUMBER 208PPB12

#### SPECIAL FEATURES

- 1 1/8 in. Square Bore
- Molded Tri-Ply seal
- Heavy outer ring

**TYPICAL APPLICATIONS**  
Disk Harrow

### BEARING NUMBER 207KRR14

#### SPECIAL FEATURES

- 1 1/4 in. Bore

**TYPICAL APPLICATIONS**  
Disk Harrow  
Transport Wheel

### BEARING NUMBER W211PPB6

#### SPECIAL FEATURES

- 1 1/2 in. Square Bore
- Tri-Ply seal with shroud cap
- Heavy outer ring

**TYPICAL APPLICATIONS**  
Disk Harrow

### BEARING NUMBER 207KYY

#### SPECIAL FEATURES

- Molded double lip seal

**TYPICAL APPLICATIONS**  
Disk Harrow  
Transport Wheel

### BEARING NUMBER G1104KRXB2

#### SPECIAL FEATURES

- Oil Seal on one side

**TYPICAL APPLICATIONS**  
Chain Case

# BALL BEARINGS

## XLS/BIC SERIES – CONRAD TYPE

- An inch-dimension series with extra large diameters.
- Conrad or non-filling slot design.
- Compact sections for adaptability in applications where space is restricted.

### DIMENSIONS – TOLERANCES

**BIH SERIES – MAXIMUM CAPACITY TYPE**

- An inch-dimension series with extra large diameters.
- Maximum capacity design.
- Feature a counterbored outer ring to permit increased number of balls.
- Can carry thrust in one direction only, against the full shouldered side of the outer race.
- Compact sections for adaptability to applications where space is restricted.

**DIMENSIONS – TOLERANCES BIH SERIES**

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.  
<sup>(2)</sup> Based on 10<sup>6</sup> revolutions of calculated fatigue life.

# BALL BEARINGS

## EXTRA LARGE 100 SERIES

- Dimensions originally established to meet specific design requirements, before standard dimensions were established by the American Bearing Manufacturers Association (ABMA).
- A metric series.
- Available in the 100 Series (extra light).
- Available in a radially-fitted counterbore type, having a maximum complement of balls.
- Identified by the suffix "WI," these are designed to take thrust in one direction only.

### DIMENSIONS – TOLERANCES

(1) Maximum shaft or housing fillet radius that bearing corners will clear.

(2) +.00 mm, -.25 mm (+000", -.010").

(3) 35 mm width.

(4) Width tolerance is +.00 mm, -.20 mm (+.000", -.008").

(5) Based on 10<sup>6</sup> revolutions of calculated fatigue life.

## 7000WN PRODUCT FAMILY

### INTRODUCTION

The high performance 7000WN Angular Contact Product Family is specifically designed to support heavy thrust loads at lower operating temperatures at high speeds. Included in the angular contact series are the following design features:

- Refined bore diameter tolerance
- Increased thrust capacity
- Extended load capacity
- Lower operating temperatures
- Better than ABEC 1 bore diameter tolerances
- High operating contact angle
- Improved ball section ratio
- Low shoulder inner and outer rings improve oil flow

A feature of this series is the refined bore diameter tolerance. The closer bore tolerance in the WN product family reduces the broad range of interference and thus prevents the development of undesirable high preload in mounted duplex pairs. As a result, longer bearing life is achieved and high operating temperatures are avoided.

This product family can support heavy thrust loads by combining high shoulders on the thrust side of both rings with a high operating angle. In addition, uniformity of load per ball under combined loads is more favorable with a high contact angle and results in longer bearing life.

Maximum clearance between the one-piece brass or bronze cage and the land diameters of both rings is achieved in the WN construction. Utilizing low shoulder diameters on the non-thrust sides of inner and outer rings promotes efficient oil passage through the bearing resulting in lower operating temperatures and longer bearing life.

The 7000WN Product Family is divided into several designs. Sizes 7207-7218WN and 7304-7318WN have a 40 degree contact angle and a one-piece, ball-piloted, pressed brass cage. Sizes 7219-7230WN and 7319-7330WN have a 40 degree contact angle and a one-piece, outer ring-piloted, high-strength machined bronze cage. The 7412WN and 7415WN both have a 40 degree contact angle and a one-piece conical, high-strength machined bronze cage.

The 7000WN Product Family is available as single bearings and duplex sets. A single with the suffix "SU" is flush ground on both faces for universal mounting. Such bearings can be used as singles or duplex mounted back-to-back (DB), face-to-face (DF) or tandem (DT), depending on the functional requirements of the design. The mounting of duplex "SU" bearings will result in a preload range of minimum internal clearance to a solid preload.

Bearings without the "SU" designation are not flush ground and are intended to be used as singles. These bearings are used to support thrust from one direction and are often accompanied by a preload spring.

Bearings with the suffix "DU" are flush ground on both faces for universal mounting. A duplex pair of "DU" bearings can be mounted (DB, DF, or DT), depending on the functional requirements of the design. These bearings, after mounting, will result in a range of positive light preload.

### APPLICATIONS

These design features are advantageous in applications such as oil refining pump systems where higher productivity and longer system life is important. Other applications where these features are equally suited are deep well pump motors, vertical and horizontal pumps, worm gear and right angle drives, spindles, live centers and gearboxes. For applications requiring a high degree of axial and radial rigidity, these bearings are suggested in preloaded duplex mountings.

### MOUNTING

Although each 7000WN Product Family bearing is a self-contained unit, the construction is such that they are frequently mounted as two bearings opposed, so that thrust can be carried in either direction.

Unlike the radial type, the angular contact bearing, when mounted alone, requires adjustment and must be installed with care. As the bearing is relatively loose axially before mounting, it is important that the design incorporate some means to move the outer ring axially into its correct position relative to the inner ring. This adjustment should be made when the bearing is mounted. A common method is to place a preload spring or shims at one bearing location.

The correct adjustment of the single bearing is obtained when the initial axial looseness of the assembly is removed. This eliminates the possibility of premature bearing damage due to excessive preloading or looseness through improper adjustment.

Bearings designated "SU" are ground on both surfaces to permit universal mounting. These duplex sets are ideally suited for applications which involve a combination of radial loads from either direction. "SU" bearings are flush ground so that under a specific axial gage load the inner ring will protrude beyond the face of the outer ring. This design results in an internal axial clearance within the bearing pair that helps to minimize build-up of excessive preload within the bearings when mounted on a shaft with maximum interference.

To assure correct mounting of bearings in the 7000WN Product Family, the word THRUST is marked on the thrust face of both the inner and outer rings. This face should abut against the housing shoulder or the end cover, depending on the required direction of "thrust".

### ORDERING INFORMATION

**"SU" Suffix:** All bearings are packaged singly. To obtain a pair of SU flush ground bearings for duplex mounting, specify two bearings. Example: (2) 7210WN SU bearings.

**"DU" Suffix:** All bearings are packaged as a pair in a single box. To obtain a pair of DU flush ground bearings for duplex mounting, specify one pair. Example: one pair-7219WN MBR-DU.

**No Suffix:** All bearings are packaged singly. No other designation is required to obtain

## LIGHT 7200WN SERIES

- Dimensionally interchangeable with the radial 200 Series.
- 7000WN Product Family includes a refined bore diameter.
- A single bearing is suggested for applications in which the thrust load is in one direction or, in the case of combined loads, the thrust load is high in relation to the radial load.
- A duplex pair is suggested for applications where thrust is present in both directions or where axial displacement of the shaft must be restricted.
- For exceptionally high thrust loads in one direction, a tandem pair can be used, opposed by a third bearing.
- Sizes 7201K through 7203WN have a 20 degree contact angle and a nylon cage.
- Sizes 7204WN through 7218WN have a 40 degree contact angle and a one-piece, ball-piloted, pressed brass cage.
- Larger sizes 7219WN through 7230WN have a 40 degree contact angle and a one-piece, outer ring piloted high-strength machined bronze cage.

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.

<sup>(2)</sup> Also available as W design.

<sup>(3)</sup> Also available with 20° contact angle and nylon cage.

<sup>(4)</sup> Based on 10<sup>6</sup> revolutions of calculated fatigue life.

**Note:** 7208WN-7212WN also available with a one-piece, high-strength machined bronze retainer (MBR). This cage can be quoted on the other sizes by request.

## MEDIUM 7300WN SERIES

- Dimensionally interchangeable with the radial 300 Series.
- The 7000WN Product Family includes a refined bore diameter. The 7300WN Series can sustain heavier thrust and combined loads than the 7200WN Series.
- A single bearing is suggested for applications in which the thrust load is in one direction or, in the case of combined loads, the thrust load is high in relation to the radial load.
- A duplex pair is suggested for applications where thrust is present in both directions or where axial displacement of the shaft must be restricted.
- For exceptionally high thrust loads in one direction, a tandem pair can be used, opposed by a third bearing.
- Size 7303W has a 20 degree contact angle and a steel cage.
- Sizes 7304WN through 7318WN have a 40 degree contact angle and a one-piece, ball-piloted, pressed brass cage.
- Larger sizes 7319WN through 7330WN have a 40 degree contact angle and a one-piece, outer ring piloted high-strength machined bronze cage.
