(1) Based on  $1 \times 10^6$  revolutions  $L_{10}$  life, for the ISO life calculation method.  
 (2) Based on  $90 \times 10^6$  revolutions  $L_{10}$  life, for The Timken Company life calculation method.  $C_{90}$  and  $C_{a90}$  are radial and thrust values for a single-row,  $C_{90(2)}$  is the two-row radial value.  
 (3) These maximum fillet radii will be cleared by the bearing corners.  
 (4) If a spacer with provision for lubricant passage is required, consult your Timken representative.

<sup>(5)</sup> These factors apply for both inch and metric calculations. Consult your Timken representative for instruction on use.

<sup>(6)</sup> For standard class (4 or 2) only, the maximum metric value is a whole millimeter dimension.

<sup>(7)</sup> Compound radius on inner race. Details on drawing for bearing.

(1) Based on  $1 \times 10^6$  revolutions  $L_{10}$  life, for the ISO life calculation method.

(2) Based on  $90 \times 10^6$  revolutions  $L_{10}$  life, for The Timken Company life calculation method.  $C_{90}$  and  $Ca_{90}$  are radial and thrust values for a single-row,  $C_{90(2)}$  is the two-row radial value.

(3) These maximum fillet radii will be cleared by the bearing corners.

(4) If a spacer with provision for lubricant passage is required, consult your Timken representative.

<sup>(5)</sup> These factors apply for both inch and metric calculations. Consult your Timken representative for instruction on use.

<sup>(6)</sup> For standard class (4 or 2) only, the maximum metric value is a whole millimeter dimension.

<sup>(7)</sup> Compound radius on inner race. Details on drawing for bearing.

(1) Based on 1 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for the ISO life calculation method.

(2) Based on 90 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for The Timken Company life calculation method. C<sub>90</sub> and C<sub>a90</sub> are radial and thrust values for a single-row, C<sub>90(2)</sub> is the two-row radial value.

(3) These maximum fillet radii will be cleared by the bearing corners.

(4) If a spacer with provision for lubricant passage is required, consult your Timken representative.

<sup>(5)</sup> These factors apply for both inch and metric calculations. Consult your Timken representative for instruction on use.

<sup>(6)</sup> For standard class (4 or 2) only, the maximum metric value is a whole millimeter dimension.

<sup>(7)</sup> Compound radius on inner race. Details on drawing for bearing.

## **ROLLER BEARINGS**

### **NOTES**

**B**

**TDI**  
DOUBLE  
INNER RACE

**TAPERED ROLLER BEARINGS**

- TDI style consists of a single piece (double) inner race plus two single outer races.
- Normally supplied complete with an outer race spacer as a pre-set assembly.
- To suit the application duty, the built-in setting value needs to be established by your Timken representative before an order is placed.
- Groove and holes in the outer race spacer allow for lubricant passage from the bearing housing.
- To obtain a price quotation, specify the bearing and spacer part numbers.

Example:      inner race                      outer race  
                         17116D - 17244  
                         Y3S - 17244 spacer

**BEARING DATA TABLES**

In the following bearing data tables, part numbers are listed in ascending order of bore, outside diameter and width.

Bearing ratings shown in tables are based on environmental reference conditions. Effects of known operating conditions on bearing performance in an application should be investigated before final bearing selection is made.

Approximate mass is listed for every part number. For weight-critical applications or exact freight cost evaluation purposes, a more accurate value should be obtained from your Timken representative.

<sup>(1)</sup> Based on 1 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for the ISO life calculation method.

<sup>(2)</sup> Based on 90 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for The Timken Company life calculation method. C<sub>90</sub> and Ca<sub>90</sub> are radial and thrust values for a single-row, C<sub>90(2)</sub> is the two-row radial value.

<sup>(3)</sup> These maximum fillet radii will be cleared by the bearing corners.

<sup>(4)</sup> A groove and holes in the outer race spacer allow for lubricant passage from the bearing housing.

| Part Number |       |                       | Dimensions, mm (inches)                        |                                            |                                                  |                                            | Factors        |                |                | Weight<br>kg (lbs.) |

<sup>(5)</sup> These factors apply for both inch and metric calculations. Consult your Timken representative for instruction on use.

<sup>(6)</sup> For standard class (4 or 2) only, the maximum metric value is a whole millimeter dimension.

<sup>(7)</sup> Compound radius on inner race. Details on drawing for bearing.

<sup>(1)</sup> Based on 1 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for the ISO life calculation method.

<sup>(2)</sup> Based on 90 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for The Timken Company life calculation method. C<sub>90</sub> and Ca<sub>90</sub> are radial and thrust values for a single-row, C<sub>90(2)</sub> is the two-row radial value.

<sup>(3)</sup> These maximum fillet radii will be cleared by the bearing corners.

<sup>(4)</sup> A groove and holes in the outer race spacer allow for lubricant passage from the bearing housing.

<sup>(5)</sup> These factors apply for both inch and metric calculations. Consult your Timken representative for instruction on use.

<sup>(6)</sup> For standard class (4 or 2) only, the maximum metric value is a whole millimeter dimension.

<sup>(7)</sup> Compound radius on inner race. Details on drawing for bearing.

<sup>(1)</sup> Based on 1 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for the ISO life calculation method.

<sup>(2)</sup> Based on 90 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for The Timken Company life calculation method. C<sub>90</sub> and Ca<sub>90</sub> are radial and thrust values for a single-row, C<sub>90(2)</sub> is the two-row radial value.

<sup>(3)</sup> These maximum fillet radii will be cleared by the bearing corners.

<sup>(4)</sup> A groove and holes in the outer race spacer allow for lubricant passage from the bearing housing.

<sup>(5)</sup> These factors apply for both inch and metric calculations. Consult your Timken representative for instruction on use.

<sup>(6)</sup> For standard class (4 or 2) only, the maximum metric value is a whole millimeter dimension.

<sup>(7)</sup> Compound radius on inner race. Details on drawing for bearing.

(1) Based on 1 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for the ISO life calculation method.  
 (2) Based on 90 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for The Timken Company life calculation method. C<sub>90</sub> and Ca<sub>90</sub> are radial and thrust values for a single-row, C<sub>90(2)</sub> is the two-row radial value.  
 (3) These maximum fillet radii will be cleared by the bearing corners.  
 (4) A groove and holes in the outer race spacer allow for lubricant passage from the bearing housing.

<sup>(5)</sup> These factors apply for both inch and metric calculations. Consult your Timken representative for instruction on use.

<sup>(6)</sup> For standard class (4 or 2) only, the maximum metric value is a whole millimeter dimension.

<sup>(7)</sup> Compound radius on inner race. Details on drawing for bearing.

<sup>(1)</sup> Based on 1 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for the ISO life calculation method.

<sup>(2)</sup> Based on 90 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for The Timken Company life calculation method. C<sub>90</sub> and Ca<sub>90</sub> are radial and thrust values for a single-row, C<sub>90(2)</sub> is the two-row radial value.

<sup>(3)</sup> These maximum fillet radii will be cleared by the bearing corners.

<sup>(4)</sup> A groove and holes in the outer race spacer allow for lubricant passage from the bearing housing.

<sup>(5)</sup> These factors apply for both inch and metric calculations. Consult your Timken representative for instruction on use.

<sup>(6)</sup> For standard class (4 or 2) only, the maximum metric value is a whole millimeter dimension.

<sup>(7)</sup> Compound radius on inner race. Details on drawing for bearing.

- (1) Based on  $1 \times 10^6$  revolutions  $L_{10}$  life, for the ISO life calculation method.
- (2) Based on  $90 \times 10^6$  revolutions  $L_{10}$  life, for The Timken Company life calculation method.  $C_{90}$  and  $Ca_{90}$  are radial and thrust values for a single-row,  $C_{90(2)}$  is the two-row radial value.
- (3) These maximum fillet radii will be cleared by the bearing corners.
- (4) A groove and holes in the outer race spacer allow for lubricant passage from the bearing housing.

(1) Based on 1 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for the ISO life calculation method.

(2) Based on 90 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for The Timken Company life calculation method. C<sub>90</sub> and C<sub>a90</sub> are radial and thrust values.

(3) Negative value indicates effective center inside cone backface.

(4) These maximum fillet radii will be cleared by the bearing corners.

(5) These factors apply for both inch and metric calculations. Consult your Timken representative for instruction on use.

Tapered - IsoClass™ Metric 3000 Series

(1) Based on 1 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for the ISO life calculation method.

(2) Based on 90 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for The Timken Company life calculation method. C<sub>90</sub> and C<sub>a90</sub> are radial and thrust values.

(3) Negative value indicates effective center inside cone backface.

(4) These maximum fillet radii will be cleared by the bearing corners.

(5) These factors apply for both inch and metric calculations. Consult your Timken representative for instruction on use.

Tapered - IsoClass™ Metric 3000 Series

(1) Based on 1 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for the ISO life calculation method.

(2) Based on 90 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for The Timken Company life calculation method. C<sub>90</sub> and C<sub>a90</sub> are radial and thrust values.

(3) Negative value indicates effective center inside cone backface.

(4) These maximum fillet radii will be cleared by the bearing corners.

(5) These factors apply for both inch and metric calculations. Consult your Timken representative for instruction on use.

Tapered - IsoClass™ Metric 3000 Series

(1) Based on 1 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for the ISO life calculation method.

(2) Based on 90 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for The Timken Company life calculation method. C<sub>90</sub> and C<sub>a90</sub> are radial and thrust values.

(3) Negative value indicates effective center inside cone backface.

(4) These maximum fillet radii will be cleared by the bearing corners.

(5) These factors apply for both inch and metric calculations. Consult your Timken representative for instruction on use.

Tapered - IsoClass™ Metric 3000 Series

(1) Based on 1 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for the ISO life calculation method.

(2) Based on 90 x 10<sup>6</sup> revolutions L<sub>10</sub> life, for The Timken Company life calculation method. C<sub>90</sub> and C<sub>a90</sub> are radial and thrust values.

(3) Negative value indicates effective center inside cone backface.

(4) These maximum fillet radii will be cleared by the bearing corners.

(5) These factors apply for both inch and metric calculations. Consult your Timken representative for instruction on use.

Tapered - IsoClass™ Metric 3000 Series

## RADIAL CYLINDRICAL ROLLER BEARINGS

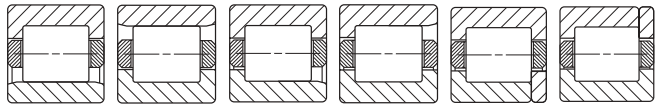

**Overview:** A radial cylindrical roller bearing consists of an inner and/or outer ring, a roller retaining cage and a complement of controlled contour cylindrical rollers. Depending on the style of bearing, either the inner or the outer ring will have two roller guiding ribs. The other ring, separable from the assembly, has one rib or none. The ring with two ribs axially locates the position of the roller assembly. The diameters of these ribs may be used to support the roller cage. One of the ribs may carry light thrust loads when an opposing rib is provided in the mating ring.

- **Sizes:** 15 mm - 65 mm (0.5906 in. to 2.5591 in.) and 100 mm - 600 mm (4 in. - 27.20 in.).
- **Markets:** Power generation, oil field, mining and aggregate processing, gear drives and rolling mills.
- **Features:** Extensive product range for integration into heavy-duty industrial applications.
- **Benefits:** Accommodate heavy radial loads through expertly designed critical dimensions, such as roller and raceway diameter and contact geometry.

## Radial Cylindrical Roller Bearings

## ROLLER BEARINGS

### SINGLE-ROW RADIAL BEARINGS – METRIC SERIES

The Timken radial cylindrical roller bearing has integral end ribs on the outer ring for end guiding the cylindrical rollers. The inner ring is separable for simplified mounting and removal.

All NU design bearings are available on request without inner rings. For this requirement add letter R in the prefix.

The modified line contact between the cylindrical rollers and raceways reduces edge stressing.

#### REFERENCE STANDARDS ARE:

- DIN 5412 single-row cylindrical roller bearings.
- ISO 246 & DIN 5412 angle rings (thrust collar).

#### TYPES OF METRIC SERIES CYLINDRICAL ROLLER RADIAL BEARINGS

#### SUFFIXES

### CONSTRUCTION

Cylindrical roller radial bearings can be recognized by the arrangement of their end ribs. Bearings of NU design have two ribs on the outer ring, the inner ring being cylindrical, making them well-suited for use as floating bearings. They are separable, which simplifies mounting and removal. Radial cylindrical roller bearings of NJ design have two ribs on the outer ring and one rib on the inner ring. They can accept axial loading in one direction.

Bearings of NUP design have two ribs on the outer ring, and one fixed and one loose rib (a flat washer) on the inner ring. These radial cylindrical roller bearings are used for locating purposes and can accept reversing axial loading. A radial cylindrical roller bearing of NJ design with an HJ Type thrust collar forms a locating bearing similar to the NUP design.

Cylindrical roller bearings of RNU Type, available on request, are supplied without an inner ring so that the cylindrical rollers run directly on a hardened and ground shaft. For most general applications, the shaft may be machined to g6 and the housing bore to K6 tolerances.

#### CAGE DESIGNS

The majority of cylindrical roller bearings of series 2..E, 22..E, 3..E and 23..E use cages of glass-fiber reinforced nylon. This cage construction allows bearings to be designed with maximum load carrying capability. These cages can also be used at operating temperatures of up to 120° C over extended periods. When bearings are lubricated with an oil, presence of additives may reduce operating life if the temperature exceeds 100° C over extended periods. Furthermore, stagnant oil may affect the performance of the cage at these temperatures, requiring oil change intervals to be strictly observed.

Suffix M indicates that the bearings use machined brass cages.

## DIMENSIONAL ACCURACY

### TOLERANCES AND BEARING CLEARANCE

Metric series radial cylindrical roller bearings are available in various tolerance classes and clearance groups. Single-row cylindrical roller bearings are made to normal clearance group C0, although bearings with radial clearance groups C2, C3 and C4 may be obtained on request.

For tolerances of radial cylindrical roller bearings see the engineering section. For radial internal clearances of radial cylindrical roller bearings see the engineering section.

### ALIGNMENT

The modified line contact between the cylindrical rollers and raceways of cylindrical roller bearings reduces stress concentration at ends of the rollers and provides some aligning capability. The angular alignment of single-row cylindrical roller bearings must not exceed a maximum of four angular minutes at a .001% load of  $C/P\partial 5$  = equivalent dynamic load, kN. At higher applied loads, or with presence of greater misalignment, consultation with Timken engineering is strongly encouraged.

## MOUNTING DIMENSIONS

The bearing inner and outer rings should be mounted against the stepped portion on the shaft and the shoulder of the housing. Under no circumstances should they interfere with the shaft or housing fillets. For this reason, the maximum fillet radius  $r_{as\ max}$  of the mating component must be no greater than the minimum chamfer dimension of the corresponding cylindrical roller bearing ring corner  $r_{s\ min}$ .

The shoulder of the mating components must be such that, even with the maximum permissible single chamfer dimension of the corresponding bearing ring, there is an adequate contact surface area. Table 1 lists the maximum fillet radius  $r_{as\ max}$  and the minimum shoulder height. At high axial loads the ribs must be supported over half their height.

$$\left( \frac{H + E}{2} \text{ and } \frac{F + J}{2} \right)$$

where from bearing tables:

- F** raceway diameter of the inner ring
- E** raceway diameter of the outer ring
- J** rib diameter of the inner ring
- H** rib diameter of the outer ring

The shaft can be mounted and removed if the mounting dimensions shown in Table 2 on page B330 are observed.

## LOAD RATINGS

### CYLINDRICAL ROLLER BEARING MAXIMUM ALLOWABLE AXIAL LOAD

Metric series cylindrical roller bearings of NUP, NJ, as well as NU or NJ designs with a thrust collar can transmit axial loads if they are radially loaded at the same time. The allowable axial load ratio  $F_a/C$  of 0.1 maximum depends to a great extent on the magnitude of radial load, the operating speed, type of lubricant used, the operating temperature, and heat transfer conditions at the bearing location. The heat balance achieved at the bearing location is used as a basis for determination of the allowable axial load.

The nomogram on page B332 should be used to determine the allowable axial load  $F_{az}$  based on the following operating conditions:

- The axial load is of constant direction and magnitude.
- Radial load ratio  $F_r/C \leq 0.2$ .
- Ratio of axial load to radial load  $F_a/F_r < 0.4$ .
- The temperature of the bearing is 80° C at an ambient temperature of 20° C.
- Lubricating oil is ISO VG 100 using oil bath lubrication or circulating oil.
- As an alternative, the bearing may be lubricated with a grease using the above specified base oil and viscosity. Use of EP additives will be necessary, although considerably shorter relubrication intervals may be expected than with purely radially loaded radial cylindrical roller bearings.

### EXAMPLE OF USING THE NOMOGRAM

From the lower part of the nomogram, determine the intersection point of the inner ring bore diameter and the dimension series of the bearing. From the upper part, the allowable axial load ratio  $F_{az}/C$  can be found as a function of the operating speed,  $n$ .

For a cylindrical roller radial bearing **NU2207E.TVP**  
 $C = 63 \text{ kN}$ ;  $d = 35 \text{ mm}$   
 $n = 2000 \text{ RPM}$   
 $F_r = 10 \text{ kN}$

From the nomogram:

$F_{az}/C = 0.06$

Then  $F_{az} = 0.06 \cdot 63$

The calculated allowable axial load  $F_{az}$  is 3.78 kN

It should be noted that an axial load as high as that determined by means of the nomogram should not be applied if an oil of rated kinematic viscosity lower than ISO VG 100 is used. Suitable EP additives, which are known for fatigue life improving qualities, may allow for an increase in applied axial load subject to thorough testing.

### HIGHER APPLIED AXIAL LOADS

Axial loads greater than those determined by means of the nomogram may be considered, providing they are to be applied intermittently. Also, the bearing should be cooled using circulating oil lubrication. If the operating temperature, due to the internal friction and the higher axial load, exceeds 80° C, a more viscous oil must be used.

## NOMOGRAM FOR DETERMINING THE ALLOWABLE AXIAL LOAD $F_{az}$

B

## INTRODUCTION

Timken heavy-duty radial cylindrical roller bearings are designed to provide the highest possible radial capacity for a given cross section, and to perform under heavy radial loads.

These bearings incorporate improved internal proportions developed through computer-assisted optimization studies to make maximum use of the total available cross-sectional area. Controlled contour rollers redistribute end-stress concentration and provide more uniform distribution of the applied load.

Cylindrical roller bearings with bore sizes from 100 mm (3.937 in.) up to 700 mm (27.5 in.) are shown in this catalog, and even larger

sizes can be provided on special order. Consult your Timken representative for complete information on your bearing size requirements.

The standard cylindrical roller bearing furnished consists of an outer ring, a complement of controlled contour rollers, a cage and an inner ring. The 5200 Series bearings include styles without an inner ring for applications where the shaft functions as the inner ring. Bearing rings and rollers are manufactured from bearing-quality steel.

B

## BEARING TYPES

### STANDARD SIZES

Six standard styles of cylindrical roller bearings are listed in this section of the catalog. All six styles have the same roller complement for a given cross section or envelope and, therefore, the same radial load capacity.

In all six styles, one ring (either the inner or the outer) has two integral roller-guiding ribs. The other ring is separable from the assembly and has either one integral rib or none. The two-rib ring locates the roller complement axially, and the ground diameter of the ribs may be used to support the cage.

Moderate thrust loads from one direction only are acceptable for those styles with three integral ribs (RJ, RF, RT and RP). The decision as to which ring should be double-ribbed is determined by conditions of assembly and mounting procedures in a specific

application. Standard cage material is fully machined brass with stamped steel also available.

For convenience, all six styles of bearings are listed in the dimension tables in order of ascending bore size, with both inch and metric sizes indicated for each bearing. ABMA designations are used for these bearings. Inch-sized bearings are identified by the letter "I" with the part number in bold type. RIU, for example, indicates an inch bearing, while RU indicates the equivalent style in metric dimensions.

All types can be mounted with interference fits on either inner or outer ring (or both). In the latter case, a bearing with increased internal clearance must be specified to provide proper running clearance.

### RIU, RU

These bearings carry radial load only and can accommodate expansion or contraction. The relative axial displacement of one ring to the other occurs with minimum friction while the bearing is rotating. These bearings may be used in one or two positions for shaft support if other means of axial location are provided. The outer ring has two integral ribs while the inner ring has a cylindrical O.D. without ribs.

RIU, RU, NU

### RIN, RN

This series has the same characteristics as RIU and RU, bearings except that two ribs are incorporated in the inner ring, and the outer ring has a cylindrical bore without ribs.

RIN, RN, N

## ROLLER BEARINGS

### RIJ, RJ

Types RIJ and RJ have double-ribbed outer and single-ribbed inner rings and can support heavy radial loads, as well as light unidirectional thrust loads up to 10 percent of the radial load. The thrust load is transmitted between the diagonally opposed rib faces in a sliding rather than a rolling action. Thus, when limiting thrust conditions are approached, lubrication can become critical.

Your Timken representative should be consulted for such applications. When thrust loads are very light, these bearings may be used in an opposed mounting to locate the shaft. In these cases, shaft endplay should be adjusted at time of assembly.

RIJ, RJ, NJ

### RIF, RF

This type has the same characteristics as RIJ and RJ, except it incorporates a double-ribbed inner ring and a single-ribbed outer ring.

RIF, RF, NF

### RIT, RT

These types have a double-ribbed outer ring and a single-ribbed inner ring with an abutting loose rib, which allows the bearing to provide axial location and to carry light thrust loads in both directions. Factors governing radial and thrust capacities are the same as for RIJ and RJ.

A type RIT or RT bearing may be used in conjunction with a type RN or RU bearing for applications where axial shaft expansion is anticipated. In these cases, the fixed bearing is usually placed nearest the drive end of the shaft to minimize alignment variations in the drive. Shaft endplay (or float) is determined by the axial clearance in the bearing.

RIT, RT, NUP

### RIP, RP

These types have the same characteristics as RIT and RT, except the inner ring is double-ribbed with a loose abutting rib.

RIP, RP, NP

B

**5200 METRIC SERIES**

The Timken 5200 metric cylindrical roller bearing offers an enhanced radial capacity in most applications due to its internal design proportions. The outer ring of a 5200 Series bearing is double-ribbed to create a recessed raceway for the complement of rollers. Style A-5200, which fits the widest variety of applications in industry, includes a full-width plain inner ring.

Because of the manufacturing tolerances established by Timken for the 5200 Series, components for any one cross section are interchangeable. This enables Timken to supply finished 5200 Series bearings to customers quickly from our complete inventory. 5200 Series bearings are available with bore sizes from 100 mm to 240 mm (3.9370 in. to 9.4488 in.).

The designer also is offered the option of specifying these bearings without the inner ring, for installations with limited radial cross sections. In these installations, the shaft serves as the inner ring and must therefore be hardened to Rc58 (minimum) and ground to a 14Ra or better surface finish.

The 5200 Series bearings are supplied with a stamped steel cage that is land-riding on the outer ring ribs (indicated by the suffix "S" on the catalog number). The cage is designed to provide free-rolling separation and also to retain the rollers. If the bearing is to be used under special conditions, such as reversing or high-speed applications, a machined brass cage is available (suffix "M" on catalog number). Your Timken representative should be consulted for specific suggestions.

The outer rings and rollers of 5200 Series bearings are made from bearing-quality alloy steel. The inner rings are deep-case hardened to accommodate the hoop stresses resulting from heavy press fits.

When supplied with an inner ring, all 5200 Series bearings have an R6 radial internal clearance as standard (see page B348). Other radial internal clearances can be provided as required by using a different inner ring. Proper roller guidance is assured by integral ribs and roller end-clearance control.

**5200**

This type carries radial load only and has a double-ribbed outer ring. It has enhanced radial capacity due to internal design proportions. The bearings are useful for installations in which limited radial cross section is available where the shaft serves as the inner ring.

5200

**A-5200-WS**

This type has the same characteristics as the 5200, except, includes a full-width cylindrical O.D. inner ring.

A-5200-WS

**A-5200-WM**

This type has the same characteristics as the WS except, with a machined brass cage.

A-52XX-WM

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.

B

# ROLLER BEARINGS

## 5200, A5200 METRIC SERIES

- Ring tolerances are found on page B348.
- Life and load calculations are found in the engineering section of this catalog.
- Shaft and housing fits, tolerances and shaft diameters are found on pages B347 and B348.

\* Inner ring can be ordered separately

### IN THE BEARING NUMBER

**W** = double ribbed outer ring.

**S** = stamped steel land-riding cage.

**M** = machined brass land-riding cage.

\*All shaft diameters are based on a housing bore to housing O.D. ratio of 0.7.

**NCF/NU**

- Single-row, full-complement cylindrical roller bearings.
- Features include integral flanges on the inner and outer rings.
- Can manage axial loads in one direction and permit small axial displacements.

## **ROLLER BEARINGS**

### **NOTES**

**B**

## SPHERICAL ROLLER BEARINGS

**Overview:** Timken spherical roller bearings feature all of the characteristics that have made Timken renowned – superior design, reliable performance and comprehensive technical support. Spherical roller bearings are designed to manage high radial loads and perform consistently, even when misalignment, marginal lubrication, contamination, extreme speeds and critical application stresses are present.

- **Sizes:** Bore sizes of 25 mm and larger.
- **Markets:** Pulp and paper, power generation, oil field, mining and aggregate processing, wind turbines, gear drives and rolling mills.
- **Features:** Large bores for integration into heavy-duty industrial applications.
- **Benefits:** High load capacity under misalignment conditions from shaft deflections or housing misalignment.

B

## Spherical Roller Bearings

**Modification and style codes:**

- K** = tapered bore
- CJ** = 2 piece steel cage - window type
- VJ** = 2 piece steel cage - finger type
- YM** = 1 piece brass cage - finger type
- YMB** = 1 piece brass, finger type, land piloted
- YMD** = 2 piece brass, finger type, land piloted
- W33** = 3 holes and groove in O.D.
- W800** = shaker screen modification:
  - tighter bore diameter and O.D. tolerances
  - brass cage
  - RIC in upper 2/3 of clearance specified
- W47** = inner ring with oversize bore

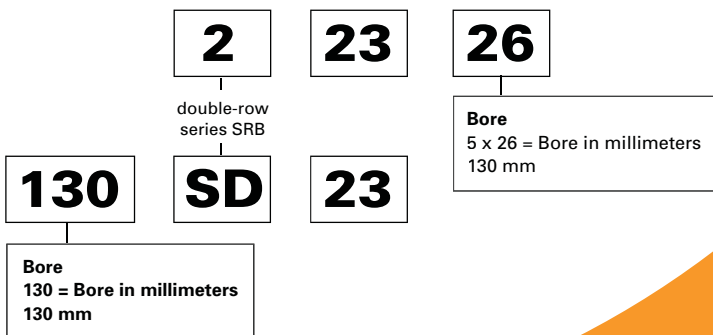

**Internal Clearance:**

- C2** less than C0
- C0** normal
- C3** greater than C0
- C4** greater than C3
- C5** greater than C4
- C6** special clearance

**Current Industry Standard:**  
22326

**Old ABMA Part Number:**  
130SD23

## ROLLER BEARINGS

### INTRODUCTION

The Timken self-aligning spherical roller bearing is a combination radial and thrust bearing, designed to operate even if shaft and housing are, or become, misaligned under load. This high-capacity bearing is the favored choice when conditions include heavy loads, plus difficulties in establishing or maintaining housing alignment, or when shaft deflection can be expected.

Shaft deflections and housing distortions caused by shock or heavy loads, which lead to misalignment, are compensated for by the internal self-alignment of the bearing elements during operation. Edge loading of rollers, a condition that limits service life on other types of bearings, does not develop in spherical roller bearings. Optimum bearing capacity can often be realized with up to  $\pm 1\frac{1}{2}$  degrees of misalignment, depending on the size and series of bearing selected.

The inherent compensation for misalignment provided by the spherical roller bearing offers the designer the opportunity to use weldments for housing frames instead of complex castings, eliminating high-cost machining operations. Even when castings may be preferred, bore alignment is less critical if spherical roller bearings are specified. Unit design and construction also make the spherical roller bearing convenient to handle during installation or maintenance.

Several types of radial spherical roller bearings include CJ, YM, YMB, YMD, and VCSJ types.

Bearings are made to RBEC-1 tolerances. Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.

### BEARING TYPES

CJ

YM

Tapered Bore with Adapter Sleeve

#### YM

- Higher load ratings for longer life.
- Incorporates advanced features and precision-machined roller-riding one piece brass cage.
- Suited for severe conditions of use.

#### YMB

- Higher load ratings for longer life.
- Incorporates advanced features and precision-machined, land-riding one piece brass cage.
- Suited for use in severe conditions.

#### YMD

- Incorporates advanced features and offers higher load ratings for longer life.
- Precision-machined, land-riding and two-pieced brass cages.
- Suited for use in severe conditions.

#### CJ

- High load ratings for longer life.
- Incorporates stamped steel window type cage for a broad range of applications.
- Utilize advanced features.

#### VCSJ

- Compact design for general use.
- Stamped steel finger type cage.

### TAPERED BORE BEARINGS WITH ADAPTER SLEEVES

- SNW adapter assemblies consist of a sleeve and locknut. Lockwashers are available for shaft mounting of tapered bore "K" bearings.
- Description of shaft mounting techniques for tapered bore bearings with adapter sleeves are found on page B380.

### SHAKER SCREEN EQUIPMENT

- Vibrating equipment commonly found in the aggregate industry is one of the most demanding applications for spherical roller bearings.
- Timken manufactures spherical roller bearings suited for high rotational speeds, high radial and impact loads, fluctuating and unbalanced loads, misalignment and extreme centrifugal forces in tough environmental conditions.
- The design allows for static and dynamic misalignment in the application while maintaining the bearing's full dynamic capacity. This achieves maximum expected service life.
- Standards and special modification codes are available for shaft (s4 or m6) and housing (P6 or H7) fits as in the engineering section.

TIMKEN SPHERICAL ROLLER BEARING MODIFICATIONS

# ROLLER BEARINGS

## SPHERICAL ROLLER BEARINGS

- Timken inventory systems are designed to provide fast delivery for frequently-ordered sizes and styles.
- Consult your Timken representative for up-to-date information about the availability of the bearings you have selected.
- Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.
- Bearings are available with a tapered bore for adapter type mounting. To order, add the suffix "K" to bearing number (e.g., 23120K).

(1) These factors apply for both inch and metric calculations. See engineering section for instructions on use.

(2) Maximum shaft or housing fillet radius that bearing corners will clear.

\* Available in standard shaker screen bearing design configuration (example: 223xxYMW33W800C4).

(3) See thermal speed ratings in the engineering section.

(4) Geometry constant for Lubrication Life Adjustment Factor a3l. See "Bearing Load Ratings and Life Calculations."

# ROLLER BEARINGS

## SPHERICAL ROLLER BEARINGS - continued

- Timken inventory systems are designed to provide fast delivery for frequently-ordered sizes and styles.
- Consult your Timken representative for up-to-date information about the availability of the bearings you have selected.
- Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.
- Bearings are available with a tapered bore for adapter type mounting. To order, add the suffix "K" to bearing number (e.g., 23120K).

CJ

(1) These factors apply for both inch and metric calculations. See engineering section for instructions on use.

(2) Maximum shaft or housing fillet radius that bearing corners will clear.

\* Available in standard shaker screen bearing design configuration (example: 223xxYMW33W800C4).

(3) See thermal speed ratings in the engineering section.

(4) Geometry constant for Lubrication Life Adjustment Factor a3l. See "Bearing Load Ratings and Life Calculations."

# ROLLER BEARINGS

## SPHERICAL ROLLER BEARINGS - continued

- Timken inventory systems are designed to provide fast delivery for frequently-ordered sizes and styles.
- Consult your Timken representative for up-to-date information about the availability of the bearings you have selected.
- Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.
- Bearings are available with a tapered bore for adapter type mounting. To order, add the suffix "K" to bearing number (e.g., 23120K).

(1) These factors apply for both inch and metric calculations. See engineering section for instructions on use.

(2) Maximum shaft or housing fillet radius that bearing corners will clear.

\* Available in standard shaker screen bearing design configuration (example: 223xxYMW33W800C4).

(3) See thermal speed ratings in the engineering section.

(4) Geometry constant for Lubrication Life Adjustment Factor a3l. See "Bearing Load Ratings and Life Calculations."

# ROLLER BEARINGS

## SPHERICAL ROLLER BEARINGS - continued

- Timken inventory systems are designed to provide fast delivery for frequently-ordered sizes and styles.
- Consult your Timken representative for up-to-date information about the availability of the bearings you have selected.
- Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.
- Bearings are available with a tapered bore for adapter type mounting. To order, add the suffix "K" to bearing number (e.g., 23120K).

(1) These factors apply for both inch and metric calculations. See engineering section for instructions on use.

(2) Maximum shaft or housing fillet radius that bearing corners will clear.

\* Available in standard shaker screen bearing design configuration (example: 223xxYMW33W800C4).

(3) See thermal speed ratings in the engineering section.

(4) Geometry constant for Lubrication Life Adjustment Factor a3l. See "Bearing Load Ratings and Life Calculations."

# ROLLER BEARINGS

## SPHERICAL ROLLER BEARINGS - continued

- Timken inventory systems are designed to provide fast delivery for frequently-ordered sizes and styles.
- Consult your Timken representative for up-to-date information about the availability of the bearings you have selected.
- Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.
- Bearings are available with a tapered bore for adapter type mounting. To order, add the suffix "K" to bearing number (e.g., 23120K).

(1) These factors apply for both inch and metric calculations. See engineering section for instructions on use.

(2) Maximum shaft or housing fillet radius that bearing corners will clear.

\* Available in standard shaker screen bearing design configuration (example: 223xxYMW33W800C4).

(3) See thermal speed ratings in the engineering section.

(4) Geometry constant for Lubrication Life Adjustment Factor a3l. See "Bearing Load Ratings and Life Calculations."

# ROLLER BEARINGS

## SPHERICAL ROLLER BEARINGS - continued

- Timken inventory systems are designed to provide fast delivery for frequently-ordered sizes and styles.
- Consult your Timken representative for up-to-date information about the availability of the bearings you have selected.
- Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.
- Bearings are available with a tapered bore for adapter type mounting. To order, add the suffix "K" to bearing number (e.g., 23120K).

(1) These factors apply for both inch and metric calculations. See engineering section for instructions on use.

(2) Maximum shaft or housing fillet radius that bearing corners will clear.

\* Available in standard shaker screen bearing design configuration (example: 223xxYMW33W800C4).

(3) See thermal speed ratings in the engineering section.

(4) Geometry constant for Lubrication Life Adjustment Factor a3l. See "Bearing Load Ratings and Life Calculations."

# ROLLER BEARINGS

## SPHERICAL ROLLER BEARINGS - continued

- Timken inventory systems are designed to provide fast delivery for frequently-ordered sizes and styles.
- Consult your Timken representative for up-to-date information about the availability of the bearings you have selected.
- Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.
- Bearings are available with a tapered bore for adapter type mounting. To order, add the suffix "K" to bearing number (e.g., 23120K).

(1) These factors apply for both inch and metric calculations. See engineering section for instructions on use.

(2) Maximum shaft or housing fillet radius that bearing corners will clear.

\* Available in standard shaker screen bearing design configuration (example: 223xxYMW33W800C4).

(3) See thermal speed ratings in the engineering section.

(4) Geometry constant for Lubrication Life Adjustment Factor a3l. See "Bearing Load Ratings and Life Calculations."

# ROLLER BEARINGS

## SPHERICAL ROLLER BEARINGS - continued

- Timken inventory systems are designed to provide fast delivery for frequently-ordered sizes and styles.
- Consult your Timken representative for up-to-date information about the availability of the bearings you have selected.
- Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.
- Bearings are available with a tapered bore for adapter type mounting. To order, add the suffix "K" to bearing number (e.g., 23120K).

CJ

(1) These factors apply for both inch and metric calculations. See engineering section for instructions on use.

(2) Maximum shaft or housing fillet radius that bearing corners will clear.

\* Available in standard shaker screen bearing design configuration (example: 223xxYMW33W800C4).

(3) See thermal speed ratings in the engineering section.

(4) Geometry constant for Lubrication Life Adjustment Factor a3l. See "Bearing Load Ratings and Life Calculations."

# ROLLER BEARINGS

## SPHERICAL ROLLER BEARINGS - continued

- Timken inventory systems are designed to provide fast delivery for frequently-ordered sizes and styles.
- Consult your Timken representative for up-to-date information about the availability of the bearings you have selected.
- Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.
- Bearings are available with a tapered bore for adapter type mounting.
- To order, add the suffix "K" to bearing number (e.g., 23120K).

| Bearing Number | d Bore          | D O.D.          | B Width          | R Fillet <sup>(2)</sup> (max.) | Backing Diameter     |                        | Load Ratings                      |                       | Equivalent Radial Load Factors <sup>(1)</sup> |                               |        | Lubrication Life Adjustment Factor <sup>(4)</sup> C <sub>g</sub> | Reference Speed Grease RPM | Thermal Ratings <sup>(3)</sup> Oil RPM | Weight kg lbs. |                              |

(1) These factors apply for both inch and metric calculations. See engineering section for instructions on use.

(2) Maximum shaft or housing fillet radius that bearing corners will clear.

\* Available in standard shaker screen bearing design configuration (example: 223xxYMW33W800C4).

(3) See thermal speed ratings in the engineering section.

(4) Geometry constant for Lubrication Life Adjustment Factor a31. See "Bearing Load Ratings and Life Calculations."

SHAFT ADAPTER ACCESSORIES FOR TAPERED BORE BEARINGS

SNW/SNP – PULL TYPE SLEEVE, LOCKNUT, LOCKWASHER/LOCKPLATE ASSEMBLIES

- The table below shows dimensions for adapter assemblies and components used in the mounting of tapered bore bearings on shafts.
- SNW assembly consists of a sleeve, locknut and lockwasher.
- SNP assembly consists of a sleeve, locknut and lockplate.

| Bearing Number | Accessory Numbers |        |         |                         | Shaft Dimensions Inchs |                    | Adapter Dimensions Inches |     |                | SNW/SNP Assembly Weight<br>lbs. |

# ROLLER BEARINGS

## SHAFT ADAPTER ACCESSORIES FOR TAPERED BORE BEARINGS

### SNW/SNP – PULL TYPE SLEEVE, LOCKNUT, LOCKWASHER/LOCKPLATE ASSEMBLIES

- The table below shows dimensions for adapter assemblies and components used in the mounting of tapered bore bearings on shafts.
- SNW assembly consists of a sleeve, locknut and lockwasher.
- SNP assembly consists of a sleeve, locknut and lockplate.

| Bearing Number           | Accessory Numbers |        |         |                         | Shaft Dimensions Inches |                    | Adapter Dimensions Inches |   |                | SNW/SNP Assembly Weight lbs. |
|--------------------------|-------------------|--------|---------|-------------------------|-------------------------|--------------------|---------------------------|---|----------------|------------------------------|

SHAFT ADAPTER ACCESSORIES FOR CYLINDRICAL BORE BEARINGS

LOCKNUT AND LOCKWASHER

- The table below shows dimensions for locknuts and lockwashers used in the mounting of cylindrical bore bearings on shafts.
- Other dimensions and tolerances related to shaft configurations also are shown.
- Dimensions are presented according to bearing bore size and are applicable to bearings in the various series (e.g., 222, 223, etc.).

| Bearing Bore | Lock-nut | Lock-washer | Thds. Per Inch | Threads    |        |            |        |            |             |                    | Shaft |      |      |      |      | Locknut        |      | Lockwasher |       |       |      |      |
|--------------|----------|-------------|----------------|------------|--------|------------|--------|------------|-------------|--------------------|-------|------|------|------|------|----------------|------|------------|-------|-------|------|------|

<sup>(1)</sup> See page B383 for suggested S-3 shaft tolerances.

# ROLLER BEARINGS

## SHAFT ADAPTER ACCESSORIES FOR CYLINDRICAL BORE BEARINGS

### LOCKNUT AND LOCKPLATE

- The table below shows dimensions for locknuts and lockwashers used in the mounting of cylindrical bore bearings on shafts.
- Other dimensions and tolerances related to shaft configurations also are shown.
- Dimensions are presented according to bearing bore size and are applicable to bearings in the various series (e.g., 222, 223, etc.).

\* Sizes N670 and above:  $\frac{3}{8}$

| Bearing Bore | Locknut | Lockwasher | Thds. Per Inch | Threads          |                   |                   |                   |                   |                   | Shaft              |                  |              |                 |                 | Locknut/Lockplate |                  |                |               |                 |                  |

(1) See page B395 for suggested S-3 shaft tolerances.

(2) C is outer ring width which may be obtained from bearing dimension tables.

## MOUNTING PROCEDURES

Depending on the size of the bearing and the application, there are different methods for mounting roller bearings. In all methods, certain basic rules must be followed.

### CLEANLINESS

- Choose a clean environment, free from dust or moisture.
- The installer should make every effort to ensure cleanliness by use of protective screens and clean cloths.

### PLAN THE WORK

- Know in advance your plans and have the necessary tools at hand. This reduces the amount of time for the job and decreases the chance for dirt to get into the bearing.

### INSPECTION AND PREPARATION

- All component parts of the machine should be on hand and thoroughly cleaned before proceeding.
- Housings should be cleaned, including blowing out the oil holes.
- Do not use air hose on bearings.
- If blind holes are used, insert a magnetic rod to remove metal chips that might be lodged there during fabrication.
- Shaft shoulders and spacer rings contacting the bearing should be square with the shaft axis.
- The shaft fillet must be small enough to clear the radius of the bearing.
- On original installations, all component parts should be checked against the detail specification prints for dimensional accuracy. Shaft and housing should be carefully checked for size and form (roundness, etc.).

### SHAFT AND HOUSING FINISH

- Shaft surfaces on which the bearing will be mounted must be clean and free from nicks and burrs.
- For applications with stationary housing and rotating shaft, it is suggested that the bearing seat on the shaft be ground to 63 RMS (micro-inches) maximum.
- If it is impractical to use a ground finish, a machined finish of 125 RMS is acceptable in many cases, but the amount of interference fit should be slightly increased.
- For a stationary outer ring, which is required to float (e.g., slide axially in the housing), a housing finish of 63 RMS maximum is suggested.
- Where the outer ring is not required to float, a surface finish of 125 RMS maximum is generally satisfactory.

**DO NOT REMOVE THE BEARING FROM ITS WRAPPING UNTIL YOU ARE READY TO MOUNT IT.**

## MOUNTING CYLINDRICAL BORE BEARINGS

### HEAT EXPANSION METHOD

- Most applications require a tight interference fit on the shaft.
- Mounting is simplified by heating the bearing to expand it sufficiently to slide easily onto the shaft.
- Two methods of heating are commonly used:
  - Tank of heated oil.
  - Induction heating.
- The first is accomplished by heating the bearing in a tank of oil that has a high flash point.
- The oil temperature should not be allowed to exceed 121° C (250° F). A temperature of 93° C (200° F) is sufficient for most applications.
- The bearing should be heated for 20 or 30 minutes, until it is expanded sufficiently to slide onto the shaft easily.
- Induction heating method is used for mounting small bearings in production line assembly.
- Induction heating is rapid. Care must be taken to prevent bearing temperature from exceeding 93° C (200° F).
- Trial runs with the unit and bearing are usually necessary to obtain proper timing.
- Thermal crayons melted at predetermined temperatures can be used to check the bearing temperature.
- While bearing is hot, it should be positioned squarely against the shoulder.
- Lockwashers and locknuts or clamping plates are then installed to hold the bearing against the shoulder of the shaft.
- As the bearing cools, the locknut or clamping plate should be tightened.
- In cases of outer ring rotation, where the outer ring is a tight fit in the housing, the housing member can be expanded by heating.
- The oil bath is shown in Figure 1. The bearing should not be in direct contact with the heat source.
- The usual arrangement is to have a screen several inches from the bottom of the tank. Small support blocks separate the bearing from the screen.
- It is important to keep the bearing away from any localized high-heat source that may raise its temperature excessively, resulting in race hardness reduction.

- Flame-type burners are commonly used. An automatic device for temperature control is desirable.
- If safety regulations prevent the use of an open heated oil bath, a mixture of 15 percent soluble-oil water may be used. This mixture may be heated to a maximum of 93° C (200° F) without being flammable.

## ROLLER BEARINGS

### ARBOR PRESS METHOD

- The alternate method of mounting, generally used only on smaller sizes, is to press the bearing onto the shaft or into the housing. This can be done by using an arbor press and a mounting tube as shown in Figure 2.
- The tube can be made from soft steel with an inside diameter slightly larger than the shaft.
- The O.D. of the tube should not exceed the maximum shoulder height given in the table of dimensions.
- The tube should be faced square at both ends. It should be thoroughly clean inside and out, and long enough to clear the end of the shaft after the bearing is mounted.

Figure 2:  
Arbor Press Method

- If outer ring is being pressed into housing, the O.D. of the mounting tube should be slightly smaller than the housing bore. The I.D. should not be less than the suggested housing basking diameter in the tables of dimensions.
- Coat the shaft with a light machine oil to reduce the force needed for a press fit.
- Carefully place the bearing on the shaft, making sure it is square with the shaft axis.
- Apply steady pressure from the arbor ram to drive the bearing firmly against the shoulder.
- Never attempt a press fit on a shaft by applying pressure to the outer ring, or a press fit in a housing by applying pressure to the inner ring.

### SHAFT MOUNTING TAPERED BORE SPHERICAL ROLLER BEARINGS

- Use a feeler gage with the thinnest blade of .0015 in.
- Place the bearing in an upright position with the inner and outer ring faces parallel.
- Place the thumbs on the inner ring bore and oscillate the inner ring two or three elements.
- Position the individual roller assemblies so that a roller is at the top of the inner ring on both sides of the bearing.
- With the roller in the correct position, insert a thin blade of the feeler gage between the roller and the outer ring.
- Move it carefully along the top roller, between the roller and outer ring raceway. Repeat this procedure, using thicker feeler gage blades, until one is found that will not go through.
- The blade thickness that preceded the "no-go" blade is a measure of RIC before installation.

- Start the mounting procedure by lubricating the tapered shaft with a light coat of machine oil.
- Slide bearing onto the shaft as far as it will go.
- As the locknut is tightened, the interference fit builds up resulting in expansion of the inner ring.
- Periodically measure to keep track of the reduction in RIC.
- Continue the procedure until the proper amount of reduction is obtained. Do not exceed suggested amount of reduction.
- As a final check, make sure that the remaining RIC equals or exceeds the minimum mounted clearance shown in the table to the right.

## MOUNTING TIMKEN® TAPERED BORE SPHERICAL ROLLER BEARINGS

| Nominal bearing bore (mm) |       | Radial Internal Clearance prior to mounting (mm) |       |       |       |       |       | Suggested reduction of RIC (mm) |       | Axial displacement tapered shaft installation (mm) |       |              |        | Minimum permissible RIC after installation |       |       |

\* Axial displacement values apply to solid steel shafts or to hollow steel shafts with bore diameter less than half the shaft diameter. For shaft materials other than steel or for thin-wall shafts, please consult your Timken representative.

\*\* 1:12 Taper used for 222, 223, 230, 231, 232, 233, 239 series. 1:30 Taper used for 240, 241, 242 series. For sleeve mounting, multiply axial displacement values by 1.1 for 1:12 taper or by 1.05 for 1:30 taper. Questions on tapered shaft data, consult your Timken representative.

Example: Bearing 22328K C3 (140 mm bore with a C3 clearance pattern) is being mounted on a tapered shaft.

a. By measuring with feeler gage, initial RIC is established to be .007 in.

b. Reference to chart above indicates proper fit is obtained when RIC is reduced by .0025 in. to .0035 in., or approximately .003 in.

Initial clearance     .007"  
Reduction of RIC     -.003"  
                                   .004"

c. Locknut is tightened until RIC reaches .004 in.. Final check against minimum RIC after mounting shows this value to be safe.

**Note:** Tapered bore bearings must have the proper amount of radial internal clearance before installation to provide for the required reduction of RIC during mounting and to compensate for any further internal reduction from abnormal temperature conditions. For special applications, send complete operating data to your Timken representative for suggestions on radial internal clearance.

- During mounting, the RIC should be checked at the unloaded roller. If this is at the bottom, make sure that the roller is raised to seat firmly at the inboard position of the inner race.
- When the suggested amount of reduction of RIC has been accomplished, the bearing is properly fitted.
- Complete the procedure by peening the lockwasher tang into the locknut slot or securing the lockplate.

## SPHERICAL ROLLER BEARING PILLOW BLOCKS

**Overview:** Spherical roller bearing pillow blocks combine rugged cast iron or steel housings with high-capacity bearings to meet the toughest demands of industry. Each pillow block contains an advanced-design spherical roller bearing with improved geometry and raceway finish for maximum load capacity and service life. Integrated housing and bearing features enhance unit lubrication characteristics. Multiple sealing options protect against contamination.

- **Sizes:** 35 mm - 300 mm shafts (1.37795 in. - 11.811 in.). Special shaft sizes up to 1000 mm (39.37 in.) and beyond.
- **Markets:** Conveyors, mining, rolling mills and pulp and paper mills.
- **Features:** Split construction for convenient assembly and disassembly. These units include pry tool slots and the exclusive Pry-Lug fulcrum, which simplify bearing inspection, service and replacement.
- **Benefits:** Caps can be removed easily and quickly without damage to the bearing or housing.

### Pillow Blocks

- SAF** two- or four-bolt pillow block, cast iron
- SDAF** four-bolt heavy duty type pillow block, cast iron
- SAFS** two- or four-bolt pillow block, cast steel
- FSAF** four-bolt pillow block, cast iron (only when an option)
- FSAFS** four-bolt pillow block, cast steel (only when an option)
- SDAFS** four-bolt heavy-duty pillow block, cast steel

To indicate shaft size and used only for pillow block units of 8 7/16 in. shaft size or larger.

**SDAF**

**23152**

**K - 9 1/2**

**FXOP**

Number indicates basic spherical bearing series. See product data charts for spherical bearing number.

**K** indicated on adapter type mounting arrangement (for 230, 231, 232 Series, SDAF231K and SDAF232K Series)  
**DV** DUSTAC seals - both sides  
**DC** DUSTAC seals - one side

**Indicate construction:**  
**FXOP** fixed open  
**FXCL** fixed closed  
**FLOP** float open  
**FLCL** float closed

## SPHERICAL ROLLER BEARINGS

### INTRODUCTION

Timken capabilities in the engineering and manufacture of heavy-duty pillow blocks provide important benefits to users.

Another very important benefit is Timken's worldwide sales organization, staffed with experienced bearing engineers who are available for consultation on any pillow block or bearing application. Expert engineering assistance is available for applications involving shaft sizes 40 inches and larger such as BOF trunnions, bridge blocks and ball mills. If your design calls for shaft sizes or loads not listed in this catalog, contact your Timken representative for information about availability of special units.

### DESIGN AND CONSTRUCTION

Timken supplies pillow blocks equipped with either tapered bore bearings plus adapters for mounting on straight shafts or cylindrical bore bearings for assembly on shouldered shafts.

Timken spherical roller bearing pillow blocks are made of split construction for convenient assembly and disassembly. These units include pry tool slots and the exclusive Pry-Lug fulcrum that simplify bearing inspection, service, and replacement. Caps can be removed easily and quickly without damage to the bearing or housing.

Precision fit is assured by the Timken system of doweling caps and bases together at an early stage of manufacturing so that they remain a single unit during machining. They are not interchangeable as separate parts and become precisely mated components.

Timken manufactures pillow blocks in two styles: SAF and SDAF. The larger SDAF block is suggested for extreme duty applications.

Caps and bases are made from high-grade stress-relieved cast iron as standard. They also are available in cast steel.

All Timken pillow blocks are designed for four-bolt mounting. Certain smaller sizes are normally furnished for two-bolt mounting. These assemblies are indicated in the tables and can be ordered with optional four-bolt base.

Four cap bolts are used in most Timken pillow blocks in order to equalize the pressure between cap and base, preventing loss of lubricant.

The illustration below shows all parts of a pillow block assembly that are described throughout this section.

Exploded view of a Timken spherical roller bearing pillow block, showing tapered bore spherical roller bearing, adapter sleeve, locknut and lockwasher, stabilizing ring and triple labyrinth seals. Recesses in cap and base, that form pry tool slot, and integral fulcrum lugs in base and cap are shown.

### MOUNTING

#### ADAPTER VS. STRAIGHT BORE

Usually a spherical roller bearing pillow block assembly is mounted on a straight shaft using a tapered bore bearing and adapter assembly. Standard commercial shafting can be used without additional machining. (Suggested shaft diameters are shown on page B395). Adapter mount also permits maximum flexibility in the axial positioning of the bearing on the shaft and will accommodate light locational thrust loads. Timken pillow blocks for tapered bore and adapter mounted bearings are available in Series 225, 226, 230, 231K and 232K.

Adapter mounted spherical roller bearings require the correct removal of diametral clearance from the bearing to prevent relative rotation between inner race and sleeve or shaft. Failure to employ proper mounting procedures can cause heating and reduced bearing performance. For proper shaft mounting of adapter type spherical roller bearings, see B380 of the spherical roller bearing section.

When application conditions produce heavy thrust loads, or a need exists for exact axial location or a positive shaft interference fit, a direct straight bore mounting may be the best option. This requires a shouldered shaft, machined for proper fit, and a straight bore bearing. Timken pillow block assemblies for straight bore applications are available in Series 222, 223, 231 and 232.

Suggested fits for shafts in cylindrical bore spherical roller bearings are shown in the engineering section. For applications involving heavy shock, vibration, unbalanced rotating loads or other abnormal conditions, consult your Timken representative.

#### FIXED AND FLOAT PILLOW BLOCKS

Any style of Timken pillow blocks can be easily installed either at the float or fixed position on the shaft. For the fixed position, a stabilizing ring is added between the bearing outer face ring and the housing shoulder to positively locate the shaft and prevent axial movement.

Some applications require centering of the bearing in its housing. To accomplish this, two special width stabilizing rings can be ordered.

In the float position, the ring is not used, allowing the bearing to move axially (a maximum of  $\frac{3}{8}$  in.) to compensate for thermal expansion or contraction of the shaft.

Pillow blocks ordered by the numbers in the dimension tables are fixed units. To order float units, specify by adding suffix "Float" or "FL" to the pillow block number.

#### CLOSED END INSTALLATIONS

In some applications, the shaft end is designed to terminate inside the pillow block. For this design, positive fitting end-closure inserts are available to seal out contaminants and retain lubricant. Timken heavy-duty end plugs include O-rings for positive sealing.

Designers and installers need to make sure the shaft end does not contact the closure. A minimum of  $\frac{1}{8}$  in. clearance at maximum thermal expansion is suggested between the end of the shaft and the closure. Dimension "Y" in the tables defines the maximum permissible length of shaft from centerline of the pillow block housing. If end closure is desired, specify by adding "CL" (one end closed) to the pillow block assembly number.

### LUBRICATION

Timken pillow block housings have been designed for grease and oil bath lubrication. They also can be modified easily to accommodate circulating oil or oil/air mist systems. Grease fittings or sight gages are available upon request.

A lubrication groove and oil holes are provided in the bearing outer ring. This feature, designated by adding suffix "W33" to the bearing number, should be specified whenever re-ordering bearings for pillow blocks. In most cases, the fresh lubricant is fed directly to the center of the bearing between the rows of rollers and distributed to the rest of the bearing. This assures the used lubricant is purged from the bearing.

### SEALS

Precision triple ring labyrinth seals are supplied with all Timken pillow blocks to exclude foreign matter and retain lubricants. The pillow block base includes extra large oil return holes at the bottom of the seal grooves to prevent leakage past the seals.

For extremely contaminated or abrasive environments, Timken has developed the exclusive DUSTAC™ seal. This patented seal offers protection against concentrations of dust or abrasive material that a labyrinth seal cannot keep out. See page B398 for further information on DUSTAC.

### LOAD RATINGS AND LIFE

Load ratings for the spherical roller bearings that are used in pillow blocks are found in the dimension tables on pages B356 through B372.

Life calculation formulas are found in the engineering section.

In addition to individual bearing selection, the ability of the pillow block to carry the operating load should be considered.

It should be noted that the load rating figures supplied in this catalog are applicable only when the load direction is generally toward the base of the pillow block. If the pillow block must be mounted so that the load could be applied in any other direction, consult your Timken representative.

**TAPERED BORE MOUNTING  
SDAF225 AND SDAF226 SERIES**

- Each assembly includes the housing cap and base, cap bolts, bearing, bearing adapter, locknut and washer, stabilizing ring and triple ring seals.
- To order pillow block housing only, use the number listed in the "Housing Only" column. These units include: cap, base, cap bolts, triple ring seals and stabilizing ring.
- Assembly and pillow blocks as described on this page constitute fixed units.
- To order float units, specify part number plus suffix "Float" or "FL".
- Assemblies shown are furnished in cast iron. If cast steel is desired, add the letter "S" to the alpha prefix (e.g., SASF 22515).

<sup>(1)</sup> See page B395 for suggested shaft diameter S-1 tolerances.

<sup>(2)</sup> "Housing Only" includes: cap, base, cap bolts, triple ring seals and stabilizing rings as required.

<sup>(3)</sup> Stabilizing ring is used for fixed (FX) block; do not use for float (FL) mounting.

<sup>(4)</sup> Includes sleeve, locknut and lockwasher. Add shaft size to order.

**Note:** Limiting speeds are found in dimension tables in the spherical roller bearing section.

# SPHERICAL ROLLER BEARINGS

## TAPERED BORE MOUNTING SAF230K, SDAF230K SERIES

- Each assembly includes the housing cap and base, cap bolts, bearing, bearing adapter, locknut and washer, stabilizing ring and triple ring seals.
- If only the pillow block is desired, use the numbers listed in column "Housing Only" column. These units include: cap, base, cap bolts, triple ring seals and stabilizing ring.
- Assembly and pillow blocks as described on this page constitute fixed units.
- To order float units, specify part number plus suffix "Float" or "FL".
- All assemblies shown are furnished in cast iron. If cast steel is desired, add the letter "S" to the alpha prefix (e.g., SAFS 23024).
- Please note that for applications SAF23048 and larger, the shaft size must be included in the part description when ordering (e.g., SAF23048-8 15/16).

Two stabilizing rings are supplied with housings SAF048 through SAF056 and SDAF060K through SDAF076K. For fixed applications **both rings must be used. Do not use stabilizing rings for float mounting.**

(1) See page B395 for suggested shaft diameter S-1 tolerances.

(2) "Housing Only" includes: cap, base, cap bolts, triple ring seals and stabilizing rings as required.

(3) Stabilizing ring is used for fixed (FX) block; do not use for float (FL) mounting.

(4) Includes adapter, locknut, lockwasher or lockplate. Add shaft size to ordering.

**TAPERED BORE MOUNTING**  
**SDAF231K AND SDAF232K SERIES**

- Each assembly includes the housing cap and base, cap bolts, bearing, bearing adapter, locknut and washer, stabilizing ring and triple ring seals.
- To order pillow block housing only, use the numbers listed in the "Housing Only" column. These units include: cap, base, cap bolts, triple ring seals and stabilizing ring.
- Assembly and pillow blocks described on this page constitute fixed units.
- To order float units, specify part number plus suffix "Float" or "FL".
- All assemblies shown are furnished in cast iron. If cast steel is desired, add the letter "S" to the alpha prefix (e.g., SDAFS 23152K).

<sup>(1)</sup> See page B395 for suggested shaft diameter S-1 tolerances.

<sup>(2)</sup> "Housing Only" includes: cap, base, cap bolts, triple ring seals and stabilizing rings as required. Add shaft size to order.

<sup>(3)</sup> Stabilizing ring is used for fixed (FX) block; do not use for float (FL) mounting.

<sup>(4)</sup> Includes sleeve, locknut and lockwasher. Add shaft size to order.

**Note:** Limiting speeds are found in dimension tables in the spherical roller bearing section.

# SPHERICAL ROLLER BEARINGS

## STRAIGHT BORE MOUNTING SAF222 AND SAF223 SERIES

- Each assembly includes the housing cap and base, cap bolts, bearing, locknut and washer, stabilizing ring and triple ring seals.
- To order pillow block housing only, use the numbers listed in "Housing Only" column. These units include: cap, base, cap bolts, triple ring seals and stabilizing ring.
- Assembly and pillow blocks described on this page constitute fixed units.
- To order float units, specify part number plus suffix "Float" or "FL".
- All assemblies shown are furnished in cast iron. If cast steel is desired, add the letter "S" to the alpha prefix (e.g., SAFS 22217).
- Four-bolt bases are standard on all assemblies, except as noted.

<sup>(1)</sup> See page B395 for suggested shaft diameter S-2, S-3 tolerances.

<sup>(2)</sup> "Housing Only" includes: cap, base, cap bolts, triple ring seals and stabilizing rings as required.

<sup>(3)</sup> Stabilizing ring is used for fixed (FX) block; do not use for float (FL) mounting.

**Note:** Limiting speeds are found in dimension tables in the spherical roller bearing section.

**STRAIGHT BORE MOUNTING  
SDAF222 AND SDAF223 SERIES**

- Each assembly includes the housing cap and base, cap bolts, bearing, locknut and washer, stabilizing ring, and triple ring seals.
- To order pillow block housing only, use the numbers listed in the "Housing Only" column. These units include: cap, base, cap bolts, triple ring seals and stabilizing ring.
- Assembly and pillow blocks described on this page constitute fixed units.
- To order float units, specify part number plus suffix "float" or "FL".
- All assemblies shown are furnished in cast iron. If cast steel is desired, add the letter "S" to the alpha prefix (e.g., SDA<sub>S</sub> 22220).

(1) See page B395 for suggested shaft diameter S-2, S-3 tolerances.  
 (2) "Housing Only" includes: cap, base, cap bolts, triple ring seals and stabilizing rings as required.  
 (3) Stabilizing ring is used for fixed (FX) block; do not use for float (FL) mounting.

**Note:** Limiting speeds are found in dimension tables in the spherical roller bearing section.

# SPHERICAL ROLLER BEARINGS

## STRAIGHT BORE MOUNTING SDAF231 AND SDAF232 SERIES

- Each assembly includes the housing cap and base, cap bolts, bearing, locknut and washer, stabilizing ring and triple ring seals.
- To order pillow block housing only, use the numbers listed in the "Housing Only" column. These units include: cap, base, cap bolts, triple ring seals, and stabilizing ring.
- Assembly and pillow blocks described on this page constitute fixed units.
- To order float units, specify part number plus suffix "Float" or "FL".
- All assemblies shown are furnished in cast iron. If cast steel is desired, add the letter "S" to the alpha prefix (e.g., SDAFS 23152).
- For fixed applications, both stabilizing rings must be used. Do not use stabilizing rings for "float" mounting.

(1) See page B395 for suggested shaft diameter S-2, S-3 tolerances.

(2) "Housing Only" includes: cap, base, cap bolts, triple ring seals and stabilizing rings as required.

(3) Stabilizing ring is used for fixed (FX) block; do not use for float (FL) mounting.

**Note:** Limiting speeds are found in dimension tables in the spherical roller bearing section.

B

Triple lip seals for other shaft diameters are available upon special order.

## SPHERICAL ROLLER BEARINGS

### TU TAKE-UP UNITS

- The same care taken in the selection of stationary pillow blocks must be applied to selecting the proper take-up unit.
- Load requirements should be carefully evaluated before specifying a particular Timken take-up assembly.
- The pedestal is made of stress-relieved cast iron. End bases are made of ductile iron. The guide rail and screw are steel.
- Units are available with travel lengths from 12 to 36 inches, in 6-inch increments.
- Catalog numbers shown here are for the TU take-up unit only; pillow block assemblies must be ordered separately.
- Both two- and four-bolt pedestals are available and must be specified.

| TU Take-Up Unit Catalog Number | Pillow Block Housing Number (SAF or SDAF) |      | A     | C      | E     | F Bolt Size | G     | H   | K      |

\* Enter 12, 18, 24, 30 or 36 to indicate travel in inches.

## TTU TAKE-UP UNITS

- The same care taken in the selection of stationary pillow blocks must be applied to selecting the proper take-up unit.
- Load requirements should be carefully evaluated before specifying a particular take-up assembly.
- Frame assembly and adjusting screw of TTU units are made of steel.
- The bearing housing is cast iron. Steel or ductile iron housings are additional options.
- Units include housing for adapter mounted bearings only, for either fixed or float position (be sure to specify).
- One stabilizing ring is included for fixed position assemblies.
- Sealing is triple ring labyrinth or end closures.
- For extremely contaminated environments, the DUSTAC seal is suggested. (See the next page for more information on DUSTAC.)

(1) See page B395 for suggested shaft diameter S-1 tolerances.

**Note:** Limiting speeds are found in dimension tables in the spherical roller bearing section.

(2) Stabilizing ring is used for fixed (FX) block; do not use for float (FL) mounting.

(3) Includes sleeve, locknut and lockwasher. Add shaft size to order.

## SPHERICAL ROLLER BEARINGS

### DUSTACT™ SHAFT SEAL

- Suggested for pillow blocks used in extremely contaminated environments, such as taconite mines.
- Provides protection against residual and airborne contaminants that exceeds the triple labyrinth shaft seal.
- Contributes significantly to extending bearing life; reduces costs by helping prevent premature bearing damage.
- Because of its unique design, no special finish is required on the shaft. DUSTAC is a patented device utilizing a V-shaped nitrile ring, which rotates with the shaft and applies pressure to the cartridge face to exclude contaminants.

### ORDER INSTRUCTIONS

- Shaft seal may be ordered in place of the standard LER triple ring seals supplied with the pillow blocks listed. They also are available to retrofit existing installations.
- To order any pillow block housings with DUSTAC shaft seal on both sides, add the suffix "DV" to the number (e.g., SAF2522DV).
- To order pillow block housings with DUSTAC shaft seal and one end closed, add the suffix "DC" to the number (e.g., SAF2252DC).
- Standard sizes of DUSTAC shaft seals are shown in the table. Other sizes are available upon request.

### INSTALLATION PROCEDURE

1. Check shaft diameters to print specification. Remove any burrs or sharp edges. Be sure shaft surface is clean and dry beyond the area of seal location.
2. Expand the V-ring seal over the shaft to the approximate inboard position (reference dimension "B" in the tables). *Make sure the lip of the seal faces the bearing.*
3. Slide the seal cartridge onto the shaft until the V-ring fits into its cavity.
4. Mount the bearing, sleeve, lockwasher and locknut in normal manner and adjust for internal clearance.
5. If both ends have seals, repeat steps 2 and 3 with the V-ring going on last with its lip facing the bearing.
6. Thoroughly clean the housing base and remove any paint or burrs from the mating surfaces of the housing cap.
7. Lower shaft, bearing and seals into the housing base, taking care to guide the seals into the seal grooves.
8. On each shaft there must be only one fixed bearing. If bearing is to be fixed, the stabilizing ring can be inserted between the bearing outer ring and the housing shoulder on the locknut side of the bearing. All other bearings on this shaft should be centered in the housing.
9. The upper half of the housing or cap should be thoroughly cleaned and checked for burrs. Place it over the bearing and seals. The dowel pins will align the cap to the base. **NOTE:** housing caps and bases are not interchangeable.
10. After cap bolts are tightened, it is most important to position the V-ring seal to its proper fitted width. This is accomplished by moving the seal until it is flush with the outside face of the cavity. This provides proper compression of the lip against the cartridge face.

## TORR-GARD SEALS

- Using the TORR-GARD greatly increases the operating time between maintenance intervals of rotating equipment.
- Used in split pillow blocks.
- Endures extreme environments such as pulp and paper, chemical and mining because of its exceptional design.
- Two-piece labyrinth seal of Teflon® PTFE fluoropolymer resin. The assembly inhibits the passage of contaminants or lubricants and prevents the components from coming apart during installation and service.
- Installation is simple compared to many other lip-contact type seals and is more effective in reducing lubricant loss, improving plant safety. It is also environmentally friendly.

B

### OTHER BENEFITS INCLUDE:

- Drop-in style eliminates machining or modification to housing.
- Interchangeable with LER or Taconite seals.
- Available for standard SAF and SNH pillow blocks (1 3/4 in. to 8 in. shaft diameter).
- Minimizes lubricant leakage.
- Accommodates greater shaft misalignment or eccentricity.
- Reduced number of components over conventional seals.

## TACONITE SEALS

### FTV SERIES

#### FLINGER TACONITE SEAL WITH V RING

- Combines the qualities of the face labyrinth seal and the DUSTAC seal to improve the sealing efficiency for extremely contaminated environments.
- The rotating flinger, added to the basic design, incorporates face labyrinth grooves and compressing the O-ring in the bore. This protects against incursion of foreign matters and ensures regular pressure of the V-ring to the cartridge face.

### FTL SERIES

#### FLINGER TACONITE SEAL WITH LIP SEAL

- The FTL seal has the same property as the FTV Series, but above the V-ring is substituted to a lip seal working directly on the Flinger Lip to prevent the shaft of any grooving.
- The FTV and FTL Taconite seals can be substituted in either ER or LER ring SAF pillow block series and do not require modifications to the standard housings.
- **NOTE:** Flinger Taconite seals can be substituted to "ER" or "LER" seal. Add the suffix "L" to the number when it is for a housing using LER Seals (e.g., TFV-515L for SAF-515L pillow block).

## SPHERICAL ROLLER BEARINGS

### SINE BAR GAGES

- Tapered bore, anti-friction bearings are mounted either on adapter sleeves or on tapered shaft seats.
- In cases where tapered bore bearings are mounted directly on the shaft, the shaft must conform to the tapered bore of the bearing to assure proper fit. If proper fit is not achieved, the results could be:
  1. Turning of the bearing inner race on the shaft.
  2. Uneven loading of the bearing.
  3. Severe inner race hoop stress.
  4. Insufficient support (back-up) of the inner race on the shaft.
- All of these conditions could lead to premature bearing damage. Therefore, the manufacture, maintenance and measurement of accurate shaft tapers is important.
- There are two accepted ways of measuring tapered shafts: ring gages and sine bar gages.
- Precision measurement of tapered shafts is difficult with ring gages and may be impossible in the case of large shafts, where gages are large, cumbersome and heavy.
- Sine bar gages provide an accurate and easy method of measurement.
- Lightweight and easy to handle and learn, sine bar gages achieve precise gaging of the shaft size and taper.

- A complete set for measurement of 1:12 shaft tapers consists of 3 in., 4 in., 5 1/2 in., 7 in., 10 in. and 14 in. sine bar gages, sine bar saddle no. T-5491-C, web clamp no. T-5489-A and a wooden box no. T-5224-C. A complete set for 1:30 shaft tapers consists of 4 in., 6 in., 8 in. and 12 in. sine bar gages.
- Sine bars can be purchased individually, or in any combination of sizes to meet your individual needs.
- All sine bars require a sine bar saddle and web clamp. A wooden box is optional.
- For information on the use of sine bars, prices and delivery, consult your Timken representative.

| T-5479-C    | 12.0000   | 24196K and up                             |

The table above represents the sine bar sizes developed for a full range of tapered bore bearings with 1:12 and a 1:30 taper. Additional sizes are available to fit a variety of width and taper combinations. Consult your local Timken representative for availability.

## HYDRAULIC NUTS

### INTRODUCTION

- Designed to install and remove tapered bore bearings with minimal effort.
- Allow better control of the bearing internal clearance reduction without damaging the bearing or other components.
- Substantially reduces downtime during installation or removal of tapered bore bearings.

### DESCRIPTION

- Consist of a female threaded ring and a male ring with two O-ring seals.
- All hydraulic nuts are supplied with:
  - Quick connection fittings (male ¼ in. B.S.P. and female 3/8 in. N.P.T.).
  - Two pipe plugs ¼" B.S.P.
  - One set of spare O-rings.

### ORDERING COMPONENTS:

- To order spare components for the hydraulic nuts, order part numbers as listed below:
  - O-ring Seal Kits:  
Use the hydraulic nut part number plus the number 132.  
Example: **HMVC 40/132**
  - Pipe Plug ¼ in. B.S.P.:  
Use the hydraulic nut part number plus the number 647.  
Example: **HMVC 40/647**
  - Quick Connection Fittings (male ¼ in. B.S.P. and female 3/8 in. N.P.T.):  
Use the hydraulic nut part number plus the number 849.  
Example: **HMVC 40/849**

### ENGINEERING SERVICES

- Special applications should be referred to a Timken representative for review.

## INSTRUCTIONS

- When the hydraulic nut is used, the piston must be in the innermost position.
- For this operation, please ensure that the valve of the hydraulic hose is disconnected from the nut so that the nut is not under pressure.
- To contract the piston inside the female threaded ring, insert a rod or bar in one of the four drilled holes located on the outside diameter of the female threaded ring.
- Screw the hydraulic nut on the thread with the piston in contact with the surface, until the groove machined on the outside diameter of the piston near the outboard face is level with the face of the female threaded ring.
- One of the two threaded holes must be plugged with the ¼" B.S.P. pipe plug before the hydraulic nut is pressurized.
- The maximum pressure permissible in the hydraulic nut is 14,000 psi (110 Kpa).
- The oil viscosity suggested is 1400 SUS (300cst) at operating temperature (SAE 90 oil).
- To avoid overextension of the piston, a second groove has been machined on the outside diameter of the piston inboard of the one used to judge contraction.
- When this second groove is level with the face of the female threaded ring, the piston has reached its length of travel as shown in the illustration. If the second groove of the piston travels past the face of the female threaded ring the hydraulic nut can be damaged.
- Should the oil start to leak from the piston area, it is certain that the O-ring seals are damaged or worn and need to be replaced.
- When the hydraulic nut is not in use, ensure that the threaded holes are plugged to prevent entry of contaminants in the piston cavity.
- To help prevent against corrosion during storage, apply a coat of light oil on the hydraulic nut surfaces.
- Contact your Timken representative to receive special warnings against reasonably unforeseen dangers.

### INSTALLATION

Hydraulic nut used to mount the bearing on a pull type sleeve.

Hydraulic nut used to mount the bearing on tapered journal.

Hydraulic nut used to mount the bearing on a push type adapter sleeve.

### REMOVAL

Hydraulic nut used to withdraw a push type adapter sleeve.

HMVC - 10 through HMVC - 64 have American National Threads Class 3.  
 HMVC - 68 through HMVC-190 have Acme General Purpose Threads Class 3G.

# SPHERICAL ROLLER BEARINGS

## SHAFT ADAPTER ACCESSORIES FOR TAPERED BORE BEARINGS

### SNW/SNP - PULL TYPE SLEEVE, LOCKNUT, LOCKWASHER/LOCKPLATE ASSEMBLIES

- The table below shows dimensions for adapter assemblies and components used in the mounting of tapered bore bearings on shafts.
- SNW assembly consists of a sleeve, locknut and lockwasher.
- SNP assembly consists of a sleeve, locknut and lockplate.

Tapered bore bearing plus SNW.

| Bearing Number | Accessory Numbers |        |         |                      | Shaft Dimensions |                    | Adapter Dimensions |     |                | SNW/SNP Assembly Weight |
|----------------|-------------------|--------|---------|----------------------|------------------|--------------------|--------------------|-----|----------------|-------------------------|
|                | Assembly          | Sleeve | Locknut | Lockwasher Lockplate | d Diameter       | Tolerance +.000" 0 | B <sub>2</sub>     | S   | D <sub>1</sub> |                         |
|                |                   |        |         |                      | in.              | in.                | in.                | in. | in.            | lbs.                    |

# SPHERICAL ROLLER BEARINGS

## SHAFT ADAPTER ACCESSORIES FOR TAPERED BORE BEARINGS

### PUSH TYPE REMOVABLE SLEEVE, LOCKNUT AND LOCKWASHER

- The chart below shows dimensions for adapter assemblies and components used in the tapered bore bearings on shafts.

B

| Bearing Number | Accessory Numbers |         |                      |             | Shaft Dimensions |             | Adapter Dimensions |        |        | C Removal Nut O.D. | Sleeve Weight |
|----------------|-------------------|---------|----------------------|-------------|------------------|-------------|--------------------|--------|--------|--------------------|---------------|
|                | Sleeve            | Locknut | Lockwasher Lockplate | Removal Nut | d Diameter       | Tolerance   | B Pitch Diameter   | L      | a      |                    |               |
|                |                   |         |                      |             |                  | +.000*<br>0 |                    |        |        |                    |               |
| mm in.         | mm in.            | mm in.  | mm in.               | mm in.      | mm in.           | mm in.      | mm in.             | mm in. | mm in. | kg. lbs.           |               |

# SPHERICAL ROLLER BEARINGS

## SHAFT ADAPTER ACCESSORIES FOR STRAIGHT BORE BEARINGS

### LOCKNUT AND LOCKWASHER

- The chart below shows dimensions for locknuts and lockwashers used in the mounting of straight bore bearings on shafts.
- Other dimensions and tolerances related to shaft configurations are also shown.
- Dimensions are presented according to bearing bore size and are applicable to bearings in the various series (e.g., 222 and 223 etc.).

B

| Bearing Bore | Locknut | Lockwasher | Threads Per Inch | Threads           |                   |                   |                   |                   |                   |
|--------------|---------|------------|------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|
|              |         |            |                  | Major Diameter    |                   | Pitch Diameter    |                   | Minor Dia.        | A Relief Dia.     |

## SPHERICAL ROLLER BEARINGS

### SHAFT ADAPTER ACCESSORIES FOR STRAIGHT BORE BEARINGS

#### LOCKNUT AND LOCKPLATE

- The chart below shows dimensions for locknuts and lockplates used in the mounting of straight bore bearings on shafts.
- Other dimensions and tolerances related to shaft configuration are also shown.
- Dimensions are presented according to bearing bore size and are applicable to bearings in the various series (e.g., 222, 223 etc.).

| Bearing Bore | Locknut | Lockplate | Threads Per Inch | Threads           |                  |                   |                   |                   |                   |
|--------------|---------|-----------|------------------|-------------------|------------------|-------------------|-------------------|-------------------|-------------------|
|              |         |           |                  | Major Diameter    |                  | Pitch Diameter    |                   | Minor Dia.        | A Relief Dia.     |
|              |         |           |                  | Min.              | Max.             | Min.              | Max.              |                   |                   |

(1) See page B395 for suggested S-3 shaft limits.

(2) C is outer ring width that may be obtained from bearing dimension tables.

B

## SPHERICAL ROLLER BEARINGS

### METRIC ADAPTER ACCESSORIES

#### PULL TYPE SLEEVES, LOCKNUTS AND WASHERS TO METRIC STANDARDS

- Sleeve numbers with the prefix "H" are listed in the chart below and are for metric standard shafts. Use metric standard locknuts, indicated by the prefix "KM" on nut number and metric standard washer, indicated by prefix "MB" on washer number.
- Metric standard sleeves are also available with bores to English standard shafts by changing letter prefix designation to "HE".
- Sleeves with bores for American standard shafts are available by using the prefix "HA".

#### EXAMPLES:

**H 316** complete assembly of sleeve with 70 mm bore, locknut and lockwasher

**HE 316** complete assembly of sleeve with 2 3/4 in. bore, locknut and lockwasher

**HA 316** complete assembly of sleeve with 2 11/16 in. bore, locknut and lockwasher

**Note:** Sleeves are not sold as separate units.

## **SPHERICAL ROLLER BEARINGS**

### **NOTES**

B

## SPHERICAL PLAIN

**Overview:** Timken's spherical plain bearings consist of a spherically ground inner ring housed in a mating outer ring without any rolling elements.

- **Sizes:** 12.7 mm - 600 mm bore (0.5 in. - 23.622 in.).
- **Markets:** Construction, mining, metals, power generation, oils and gas, aggregate, paper and forest products.
- **Applications:** Articulation joints, A-frames, cylinders (steering, lift, tilt, dump), struts, traction bars.
- **Features:** Lubrication grooves and holes, seals to retain lubricant and prevent contamination, special materials available.
- **Benefits:** Can carry radial and axial loads in a small envelope and can accommodate moderate misalignment.

## Spherical Plain Bearings

One, two, or three digit "Series" number.  
*For inch series*, the number indicates the nominal bore size (e.g., 10 is 1.00 in.) or an approximate bore size (e.g., 17 is 1.75 in.).  
*For metric series*, the number indicates the exact bore size (e.g., 40 is 40 mm).

7

SF

**Seal Designator:**  
**TT** reinforced rubber seals  
**SS** synthetic resin seals

12 - SS

**SF** spherical plain type (radial inch); single fractured outer ring  
**SFH** spherical plain type (radial inch); single fractured outer ring, wide inner ring  
**SBB** spherical plain type (radial inch); double fractured outer ring  
**SBT** spherical plain angular contact type (radial inch)  
**FS** spherical plain type (radial metric); single fractured outer ring  
**FSH** spherical plain type (radial metric); single fractured outer ring, wide inner ring

One, two, or three digit number.  
*For inch series*, the number indicates the exact bore size in  $\frac{1}{16}$ ths of an inch (e.g., 12 refers to  $\frac{12}{16}$  in. which is a  $\frac{3}{4}$  in. bore).  
*For metric series*, the number indicates the exact outside diameter size (e.g., 62 is 62 mm).

## SPHERICAL PLAIN BEARINGS

### INTRODUCTION

The spherical plain bearing has a spherically shaped inner ring with a ground cylindrical bore for shaft mounting. The cylindrical outer surface of the outer ring permits convenient mounting in a housing.

Spherical plain bearings offer the following advantages:

- High capacity
- Ability to accommodate misalignment
- Superior performance in low frequency oscillating applications
- Simplified housing and shaft design
- Easy installation
- Radial types available with seals

For all types of spherical plain bearings, both the inner and outer rings are manufactured from through-hardened steel and are precision ground.

The dimensional data lists spherical plain bearings successively by larger bore sizes.

Timken also supplies spherical plain bearings made to special designs. These include standard design bearings made with special materials, clearances, and finishes or bearings with special configurations, such as extended inner rings.

B

### GENERAL FEATURES

#### METAL ON METAL BEARINGS

Rings are phosphate treated and coated with molybdenum disulfide ( $MoS_2$ ) to minimize friction of contacting surfaces.

These bearings are available as radial types (SF Series and FS Series) and angular contact thrust (SBT Series).

SF and FS Series include lubrication holes and grooves in both inner and the outer rings to permit relubrication through either the shaft or housing.

SBT angular contact bearings have lubricating holes and grooves in the outer ring for relubrication through the housing.

SF and FS Series are available with integral seals as SF...TT, SF...SS, FS...TT and FS...SS, and incorporate lip seals designed to retain lubricant and protect the spherical surfaces from external contamination.

### BEARING TYPES

#### SF & FS

These bearings are designed primarily to carry radial loads and handle moderate misalignment. The outer ring is usually fractured axially in one place, parallel to its axis, to permit assembly of the bearing rings, which do not have loading slots.

These types can also be supplied with double-fractured outer rings (designation SBB) when this feature is desired for easier assembly in an application.

SF and FS

#### SF...TT, SF...SS, FS...TT, FS...SS

These bearings are dimensionally interchangeable with the SF and FS Series, and have the same general characteristics. However, they also incorporate lip seals.

The seals are securely retained in the outer ring and will withstand high grease pressures during relubrication. Positive retention of the seals assures full distribution of the lubricant to all bearing surfaces. SF...TT and FS...TT incorporate two reinforced nitrile rubber seals. SF...SS and FS...SS are assembled with synthetic resin seals; Operating temperatures of the seals should not exceed 212° F (100° C).

SF and FS

#### SBT & SBDT

These bearings are designed for single direction thrust loading and some misalignment. Inner and outer rings are separable. The raceways are essentially hemispherical, and the rings are designed to provide maximum spherical raceway contact in the axial direction.

The SBDT style is designed for single direction thrust loading while the SBDT style is designed for thrust loading in two directions

SBT

SBDT

## INTERNAL CLEARANCES

Radial internal clearance is defined as the total possible movement of the inner ring relative to the outer ring in a radial direction. Axial internal clearance is the total possible movement of the inner relative to the outer ring in an axial direction.

Radial internal clearances listed for the SF and FS Series are for finish ground, unmounted bearings prior to fracture of the outer ring. The molybdenum disulfide coating reduces this clearance by a maximum of .05 mm (.002 in.). The maximum interference fits using suggested housing and shaft dimensions will maintain a satisfactory minimum internal clearance in the mounted condition, accommodating coating thickness, outer ring compression, and inner ring expansion.

## LOAD RATINGS

### DYNAMIC LOAD RATINGS

#### SF & FS

The dynamic load rating listed in the tables of dimensions is based on a maximum stress level of 85 megapascals (approximately 12,300 psi) between the sliding contact surfaces. It is the maximum load suggested for bearings subjected to intermittent operation with periodic lubrication.

The dynamic load rating is based on the radially projected area of the inner ring bore under the condition where, with the suggested fitting practice and periodic lubrication, rotation normally takes place.

For intermittent loading and operation, the applied radial load should not exceed the dynamic load rating. For constant loading and continuous operation, the applied radial load should not exceed 75 percent of the dynamic load rating. For dynamic or static thrust loading, use 25 percent of the respective radial load rating value should be used. For combined radial and thrust ratings, consult your Timken representative.

#### SBT

The dynamic load rating is based on the same stress levels as SF shown above and is the maximum thrust load suggested for extended life with periodic lubrication. It is based on the axially projected area of the spherical surfaces in contact. Where the shaft shoulder supports high thrust loads, it is suggested that hardened shafts be employed.

### EQUIVALENT THRUST LOAD

#### SBT

For combined radial and thrust loading under intermittent dynamic conditions, the equivalent thrust load ( $T_e$ ) must not exceed the dynamic load rating. For constant loading and continuous operation, the equivalent load ( $T_e$ ), or the axial load (T) when the radial load (R) is zero, must not exceed 70 percent of the dynamic load rating:

$$T_e = T + 1.4R$$

$T_e$  = Equivalent thrust load per bearing

T = Applied thrust load and/or preload

R = Applied radial load per bearing

The limit load rating of all spherical plain bearings listed is the maximum static load that can be applied to the bearing. This load should not be exceeded. The ultimate, or static fracture rating of the bearing is at least 1.5 times the limit load rating.

Shaft and housing stresses should be checked when the applied load approaches the limit load rating since the shaft or housing may then become the critical factor.

## SPHERICAL PLAIN BEARINGS

### MISALIGNMENT

In many applications, the degree of misalignment of the radial types of spherical plain bearings is determined by the side clearance between the yoke and the bearing housing as illustrated.

When the bearing is mounted without such restrictions, a larger misalignment can be accommodated:  $\alpha$  is the maximum angle of misalignment for sealed bearings as illustrated. If  $\alpha$  is exceeded, the seal lips will slide off the spherical surface. Seal effectiveness is then lost and damage to the seal lip will occur if contact is made between the seal lip and shaft shoulder.

Greater misalignment under light to medium loads is possible with unsealed plain radial bearings as shown by angle  $\alpha'$ . This requires limiting the shaft shoulder diameter to the suggested dimension ( $d_a$ ) and also requires sufficient side clearance for the outer ring and housing.

Misalignment greater than  $\alpha'$  reduces the load carrying ability of the radial plain spherical bearings. When extreme misalignment is present, the strength of the shaft in shear and bending should be carefully checked, since the shaft support may be some distance away from the bearing.

Side clearance between yoke and bearing housing

Maximum tilt sealed bearing

Maximum tilt unsealed bearing

Type SBT angular contact bearing permits a tilting angle  $\alpha$  provided the housing shoulder clears the shaft. Such misalignment is limited by the bore of the outer ring touching the through shaft, as shown. A larger angle of misalignment is possible where a stub shaft is used. If the tilting angle exceeds  $\alpha$ , your Timken representative should be consulted for suggestions.

Maximum tilt (provided housing shoulder clears shaft)

## HOUSING DESIGN

The housing should be strong enough to support the loads applied to the bearings without distortion or risk of fatigue damage.

When using a housing of the type illustrated, with a load applied in directions "X" or "Y", the compressive yield strength of the housing material should be greater than the applied load divided by  $(B_a \cdot D)$ .

When the load is applied in direction "Y", the yield strength of the housing in tension should be greater than the applied load times  $K/B_a(D_a-D)$ , where K is a stress concentration factor from Table 1.

The suggested housing bore tolerances closely approximate N7 tolerances. This produces an interference fit that ensures proper rounding of the outer ring. Light metal housings or housings with thin cross sections may require a tighter fit. An interference fit in the housing is also necessary to prevent creeping by the outer ring with resultant wear of the housing bore and shoulder. Split housings should be avoided.

To resist thrust loads, the bearing should be mounted as shown in the mounting details above the table dimensions.

When plain angular contact bearings (SBT) are axially loaded, the housing expands. For proper and safe bearing function, it is vital to provide a substantial section for the housing. If the thrust limit load ratings are applied for these bearings, not only should the section of the housing be generous, but the housing bore diameter ( $d_b$ ) must not be exceeded. This not only supports the thrust load, but strengthens the housing in the radial direction as well.

The suggested housing bore for the Type SBT angular contact bearing produces a tight transition fit.

TABLE 1 – STRESS CONCENTRATION FACTOR

| $D_a/D$ | K   | $D_a/D$ | K   | $D_a/D$ | K   |
|---------|-----|---------|-----|---------|-----|
| 1.2     | 1.8 | 1.8     | 2.4 | 3       | 3.7 |
| 1.4     | 2   | 2       | 2.7 | 4       | 4.7 |
| 1.6     | 2.2 | 2.5     | 3.2 | 5       | 5.5 |

Housing section - angular contact bearing

## SHAFT DESIGN

In applications with heavy radial loads, although alignment takes place at the spherical bearing surface, rotation or oscillation normally occurs between the bore of the inner ring and the shaft even though an interference fit may have been used. For this reason, and to facilitate assembly, the shaft dimensions listed in the tables should be used.

To obtain satisfactory performance with heavy loads or under abrasive conditions, the shaft should be hardened to 655 VPN or 58 HRC minimum. Additionally, the shaft should have sufficient strength to withstand the applied loads in both shear and bending. The surface finish of the bearing seat should not exceed 0.8 micrometers or 32 microinches (on the Ra scale). The shaft should always be supported as close to the inner ring as possible to minimize bending.

When the loads are light, it is possible to prevent rotation between the inner ring and shaft by using an ISO m6 shaft tolerance or by clamping across the inner ring. Under these conditions, a fully hardened shaft is not necessary.

When the bearing is loaded axially, the load is transmitted between the end face of the inner ring and the adjacent shaft shoulder. The shoulder surface must be of sufficient strength and hardness not to deform permanently under load. If the inner ring is to rotate, the finish of this surface should not exceed 0.8 micrometers or 32 microinches (on the Ra scale).

## SPHERICAL PLAIN BEARINGS

### LUBRICATION (SF, FS, SBT)

The dry film lubricant (MoS<sub>2</sub>) is sufficient for static applications and for relatively short periods of dynamic operation.

The bonds between the rings and MoS<sub>2</sub> coating may be destroyed by any fluid including oils, greases and water. Any abrasive material present on the dynamic bearing surfaces will ruin the MoS<sub>2</sub> coating. If the bearing is subjected to such operating or environmental conditions, it is necessary to relubricate frequently.

The radial bearings, both with and without seals, have lubricating holes and grooves in both the inner and outer rings, permitting relubrication through either the shaft or the housing.

The angular contact bearings have lubricating holes and grooves in the outer ring for relubrication through the bearing housing. The lubrication grooves in the spherical bore of the outer ring traverse a pattern designed to provide effective lubrication. These grooves extend into the small bore of the ring, permitting relubrication through the end of the housing as illustrated.

The relubrication cycle will depend on the magnitude of the load, frequency and amplitude of oscillation, environmental conditions and the effectiveness of the sealing used to exclude foreign materials from the bearing surfaces.

If bearings are relubricated, the dynamic load rating depends on the film strength of the added lubricant. High quality EP greases are suggested for best results.

SBT – Relubricatable mounting

### TEMPERATURE

Spherical plain bearings without seals will operate satisfactorily up to temperatures of 392° F (200° C). For operation at greater temperatures, special materials and lubricants will be required. Operating temperatures for sealed bearings should not exceed 212° F (100° C).

### SHAFT FITS

- The shaft diameters listed in the dimension tables show the suggested fits for normal service.
- The table below is to be used only for applications where a shaft interference fit is required. Consult your Timken representative for suggestions.

#### (SF, SFH, FS, FSH, SBT) BEARINGS,

#### Shaft Diameter Tolerance for Interference Fit for Inch and Metric Series

| Bore Diameter, d |       |        |        | Shaft Tolerance<br>m6 |        |         |         |

**TOLERANCES**

- Tolerances on pages B412-B420 list the nominal bearing dimensions.
- Tolerances for these dimensions are listed in Tables 1 through 4. They are expressed as variances from nominal.
- Metric-inch conversions are shown in the following tables.

**TABLE 1 INNER RING (FS, FSH) BEARINGS, METRIC SERIES**

<sup>(2)</sup> Tolerances apply before coating with MoS<sub>2</sub> and fracturing outer ring. "Single Mean Diameter" is defined as the mean diameter in a single radial plane.

# SPHERICAL PLAIN BEARINGS

## RADIAL BEARINGS TYPE SF

B

- Unit assembly consisting of a solid, spherical O.D. inner ring and a spherical I.D. outer ring.
- Outer ring has a single fracture to permit assembly.
- Both inner and outer rings are phosphate treated and then coated with molybdenum disulphide (MoS<sub>2</sub>).
- Bearings 7SF12 through 50SBB80 are available with reinforced rubber seals. To order, add suffix “-TT” to bearing designation – Example: 25SF40-TT.
- Bearings 27SF44 through 608BB96 are available with synthetic resin seals. To order, add suffix “-SS” to bearing designation – Example: 27SF44-SS.
- Before ordering any bearing, check for availability.
- Metric-inch conversions have been included. The controlling dimensions are in inches.
- For tolerances, see Tables 3 and 4. Dimensions listed are after the bearing has been coated with molybdenum disulphide.

- The axial internal clearance is approximately three times the radial internal clearance.
- $\alpha$  is the maximum tilting angle for sealed radial bearings. To utilize the maximum tilting angle  $\alpha$  for unsealed radial bearings, the suggested shaft shoulder diameter,  $d_a$ , shown in the drawing on the facing page, must not be exceeded.
- Dimensions and locations of lubrication holes and grooves may be obtained from your Timken representative.

\* Prior to coating with MoS<sub>2</sub> and fracturing outer ring.

**MOUNTING**

- Housing bore dimensions listed below are applicable to bearings mounted in steel.
- Because of fracturing, the outer ring may be slightly out-of-round.
- Roundness will be restored when the bearing is mounted in a housing of sufficient cross section.
- Preferred shaft and housing bore dimensions are listed below.
- Refer to the m6 tolerance limits per ANSI B4.1 in the Shaft Diameter Tolerance table on page B410 for a shaft interference fit.

**MOUNTING DIMENSIONS**

\* For bearing sizes 5SF8 through 25SF40, shaft and shoulder should be undercut to eliminate fillet.

† Equal to minimum inner ring bore chamfer.

‡ Equal to minimum outer ring O.D. chamfer.

# SPHERICAL PLAIN BEARINGS

## RADIAL BEARINGS TYPE FS

- Type FS spherical plain radial bearing is a unit assembly consisting of a solid, spherical O.D. inner ring and a spherical I.D. outer ring.
- The outer ring has a single fracture to permit assembly. Both inner and outer rings are phosphate treated and then coated with molybdenum disulphide (MoS<sub>2</sub>).
- Bearings 16FS30 through 60FS90 are available with reinforced rubber seals. To order, add suffix "TT" to bearing designation - Example: 16FS30-TT.
- Bearings 70FS105 through 300FS430 are available with synthetic resin seals. To order, add suffix "SS" to bearing designation - Example: 70FS105-SS.
- Before ordering any bearing, check for availability.
- Type FS bearings are a metric series which follows proposed International Standards Organization (ISO) standards. Metric-Inch conversions given are for the convenience of the user. The controlling dimensions are in millimeters.

- For tolerances of nominal dimensions see the tables 1 and 2 on page B411. Dimensions listed are before coating with molybdenum disulphide. The axial internal clearance is approximately three times the radial internal clearance.
- $\alpha$  is the maximum tilting angle for sealed radial bearings. To utilize the maximum tilting angle for unsealed radial bearings the suggested shaft shoulder diameter  $d_{a1}$  shown in the drawing on facing page must not be exceeded.
- Dimensions and locations of lubrication holes and grooves may be obtained from your Timken representative.

### DIMENSIONS - LOAD RATINGS

| Bearing Number | Bore d |         | Outside Diameter D |         | Inner Ring Width B <sub>1</sub> |       | Outer ring Width B |       | Spherical Diameter d <sub>1</sub> |        | Radial Clearance* (unmounted) |      |      |      | Radial Load Rating | Dynamic Radial Load Rating |         |        |
|----------------|--------|---------|--------------------|---------|---------------------------------|-------|--------------------|-------|-----------------------------------|--------|-------------------------------|------|------|------|--------------------|----------------------------|---------|--------|

\* Prior to fracturing outer ring.

**MOUNTING**

- Due to fracturing, the outer ring may be slightly out-of-round. Roundness will be restored, however, when the bearing is mounted in a housing of sufficient cross section.
- The preferred shaft tolerance is f6 as listed below per ANSI B4.2. To obtain a shaft interference fit, refer to the m6 tolerance limits listed in the Shaft Diameter Tolerance table on page B410.

**LOAD RATING**

- The “dynamic load rating” is the maximum load suggested for extended life with periodic lubrication. It is based upon the radially projected area of the inner ring bore and an allowable stress level of 85 megapascals (approximately 12,300 psi).

- For intermittent loading and intermittent operation, the applied radial load should not exceed the dynamic load rating. For constant loading and continuous operation, the applied radial load should not exceed 75 percent of the dynamic load rating. For dynamic or static thrust loading, use 25 percent of respective radial load values. For combined radial and thrust loading, consult your Timken representative.
- The “limit load rating” is the maximum static load that can be applied to a Timken spherical plain bearing. Shaft and housing stresses should be checked when the load approaches the limit load rating since the shaft or housing may then become the critical member. The ultimate, or static fracture, rating of the bearing is at least 1.5 times the limit load rating.
- Load ratings are given in pounds-force:  
1 lbf = 0.454kgf = 4.448 N.

**MOUNTING DIMENSIONS**

\* For bearing sizes 5SF8 through 25SF40, shaft and shoulder should be undercut to eliminate fillet.  
 † Equal to minimum inner ring bore chamfer.  
 ‡ Equal to minimum outer ring O.D. chamfer.

# SPHERICAL PLAIN BEARINGS

## RADIAL BEARINGS TYPE FSH

- The FSH spherical plain radial bearing is a unit assembly consisting of a solid spherical O.D. inner ring and a spherical I.D. outer ring.
- The outer ring has a single fracture to permit assembly. Both inner and outer rings are phosphate treated and then coated with molybdenum disulphide (MoS<sub>2</sub>). The type FSH bearing is similar to type FS, but the inner ring bore diameter has been reduced and the width made greater to increase the spherical surface. This permits greater misalignment while maintaining full bearing contact.
- Bearings 14FSH30 through 50FSH90 are available with reinforced rubber seals. To order, add suffix "TT" to bearing designation - Example: 14FSH30-TT.
- Bearings 60FSH105 through 280FSH430 are available with synthetic resin seals. To order, add suffix "SS" to bearing designation - Example: 60FSH105-SS.
- Before ordering any bearing, check for availability.

### DIMENSIONS

- Type FSH bearings are a metric series which follows proposed International Standards Organization (ISO) standards. Metric Inch conversions given are for the convenience of the user. The controlling dimensions are in millimeters.

- For tolerances of nominal dimensions, see Tables 1 and 2 on page B411. Dimensions listed are before coating with molybdenum disulphide. The axial internal clearance is approximately three times the radial internal clearance.
- $\alpha$  is the maximum tilting angle for sealed radial bearings. To utilize the maximum tilting angle for unsealed radial bearings, the suggested shaft shoulder diameter  $d_{a1}$  shown in the drawing on facing page must not be exceeded.
- Dimensions and locations of lubrication holes and grooves may be obtained from your Timken representative.

### DIMENSIONS - LOAD RATINGS

\* Prior to fracturing outer ring.

**MOUNTING**

- The housing bore dimensions given below are applicable to bearings mounted in steel.
- Due to fracturing, the outer ring may be slightly out-of-round. Roundness will be restored, however, when the bearing is mounted in a housing of sufficient cross section.
- The preferred shaft tolerance is f6 as listed below per ANSI B4.2. To obtain a shaft interference fit, refer to the m6 tolerance limits listed in the Shaft Diameter Tolerance table on page B410.

**LOAD RATING**

- The “dynamic load rating” is the maximum load suggested for extended life with periodic lubrication. It is based upon the radially projected area of the inner ring bore and allowable stress level of 85 megapascals (approximately 12,300 psi).

- For intermittent loading and intermittent operation, the applied radial load should not exceed the dynamic load rating for constant loading and continuous operation, the applied radial load should not exceed 75 percent of the dynamic load rating. For dynamic or static thrust loading, use 25 percent of respective radial load rating values. For combined radial and thrust loading, consult your Timken representative.
- The “limit load rating” is the maximum static load that can be applied to a Timken spherical plain bearing. Shaft and housing stresses should be checked when the load approaches the limit load rating since the shaft or housing may then become the critical member. The ultimate or static fracture rating of the bearing is at least 1.5 times the limit load rating.
- Load ratings are given in pounds force:  
1 lbf = 0.454 kgf = 4.448N.

\* For bearing sizes 5SF8 through 25SF40, shaft and shoulder should be undercut to eliminate fillet.

† Equal to minimum inner ring bore chamfer.

‡ Equal to minimum outer ring O.D. chamfer.

# SPHERICAL PLAIN BEARINGS

## RADIAL BEARINGS TYPE SFH

- The SFH spherical plain radial bearing is a unit assembly consisting of a solid spherical O.D. inner ring and a spherical I.D. outer ring. The outer ring has a single fracture to permit assembly. Both inner and outer rings are phosphate treated and then coated with molybdenum disulphide (MoS<sub>2</sub>).
- The type SFH bearing is similar to type SF, but the inner ring bore diameter has been reduced and the width made greater to increase the spherical surface. This permits greater misalignment yet maintains full bearing contact.
- Bearings 12SFH24 through 22SFH40 are available with reinforced rubber seals. To order, add suffix "TT" to bearing designation - Example: 22SFH40-TT.
- Bearings 25SFH44 through 55SFH96 are available with synthetic resin seals. To order, add suffix "SS" to bearing designation - Example: 25SFH44-SS.
- Before ordering any bearing, check for availability.

### DIMENSIONS

- Inch-metric conversions given are for the convenience of the user. The controlling dimensions are in inches.
- For tolerances of nominal dimensions, see Tables 2 and 2A on page B411. Dimensions listed are after coating with

MoS<sub>2</sub> except outer ring O.D. and internal clearance are before coating and fracturing. The axial internal clearance is approximately three times the radial internal clearance.

- $\alpha$  is the maximum tilting angle for sealed radial bearings. To utilize the maximum tilting angle for unsealed radial bearings, the suggested shaft shoulder diameter  $d_a$ , shown in the drawing on facing page must not be exceeded.
- Dimensions and locations of lubrication holes and grooves may be obtained from your Timken representative.

### DIMENSIONS - LOAD RATINGS

\* Prior to fracturing outer ring.

## MOUNTING

- The housing bore dimensions given below are applicable to bearings mounted in steel.
- Due to fracturing, the outer ring may be slightly out-of-round. Roundness will be restored, however, when the bearing is mounted in a housing of sufficient cross section.
- The preferred shaft tolerance is g6 as listed below per ANSI B4.1. To obtain a shaft interference fit, refer to the m6 tolerance limits listed in the Shaft Diameter Tolerance table on page B410.

## LOAD RATING

- The “dynamic load rating” is the maximum load suggested for extended life with periodic lubrication. It is based upon the radially projected area of the inner ring bore and an allowable stress level of 85 megapascals (approximately 12,300 psi).

- For intermittent loading and intermittent operation, the applied radial load should not exceed the dynamic load rating. For constant loading and continuous operation, the applied radial load should not exceed 75 percent of the dynamic load rating. For dynamic or static thrust loading, use 25 percent of respective radial load rating values. For combined radial and thrust loading, consult your Timken representative.
- The “limit load rating” is the maximum static load that can be applied to a Timken spherical plain bearing. Shaft and housing stresses should be checked when the load approaches the limit load rating since the shaft or housing may then become the critical member. The ultimate, or static fracture, rating of the bearing is at least 1.5 times the limit load rating.
- Load ratings are given in pounds force:  
 $1\text{ lbf} = 0.454\text{ kgf} = 4.448\text{ N}$ .

\* For bearing sizes 5SF8 through 25SF40, shaft and shoulder should be undercut to eliminate fillet.

† Equal to minimum inner ring bore chamfer.

‡ Equal to minimum outer ring O.D. chamfer.

## SPHERICAL PLAIN BEARINGS

### ANGULAR CONTACT BEARINGS TYPE SBT

- Separable assembly consisting of an inner and outer ring with hemispherically shaped surfaces that mate with each other.
- Both inner and outer rings are phosphate-treated and coated with molybdenum disulphide (MoS<sub>2</sub>).
- If a Timken ring is assembled with a ring of another make, consult your Timken representative.
- To order inner and outer rings separately, specify by adding suffix "-OR" for outer ring or "-IR" for inner ring.
- Metric-inch conversions are provided for the convenience of the user. The controlling dimensions are in inches.
- See Table 2 and 3 for tolerances. Dimensions listed are after the bearing has been coated with molybdenum disulphide.
- $\alpha$  is the maximum tilting angle through the shaft. A stub shaft can be used to obtain a larger angle.
- Dimensions and locations of lubrication holes and grooves may be obtained from your Timken representative.

**MOUNTING**

- Housing bore dimensions listed are appropriate for bearings mounted in steel.
- Suggested diameters of shoulder supports should be used to assure proper function of the bearing.
- Preferred shaft and housing bore dimensions are listed below per ANSI B4.1.
- Refer to the m6 tolerance limits listed in the Shaft Diameter Tolerance table on page B410 for shaft interference fit.
- Bearings are to be mounted with sufficient axial preload to ensure contact of the spherical surfaces under all load conditions.

Maximum tilt for bearing

Mounting detail

## THRUST BEARINGS

**Overview:** Timken thrust bearings are designed specifically to manage thrust loads and provide high-shock-load resistance in industrial and automotive applications. We manufacture seven basic designs of thrust bearings that include ball, crossed roller, cylindrical, machined tapered (TTHD, V-Flat, screwdown), stamped tapered, spherical and needle.

- **Sizes:** 35 mm - 2940 mm (1.375 in. - 115.75 in.).
- **Markets:** Aggregate, Machine Tool, Metals, Oil, Power Generation.
- **Applications:** Cone crushers, crane hooks, oil well swivels, extruders, pulverizer drives, rolling mills, machine tool spindles & tables, drilling rig hydraulic heads, gear boxes, pre-heater fans.
- **Benefits:** High performance and application flexibility. Large range of product offering.

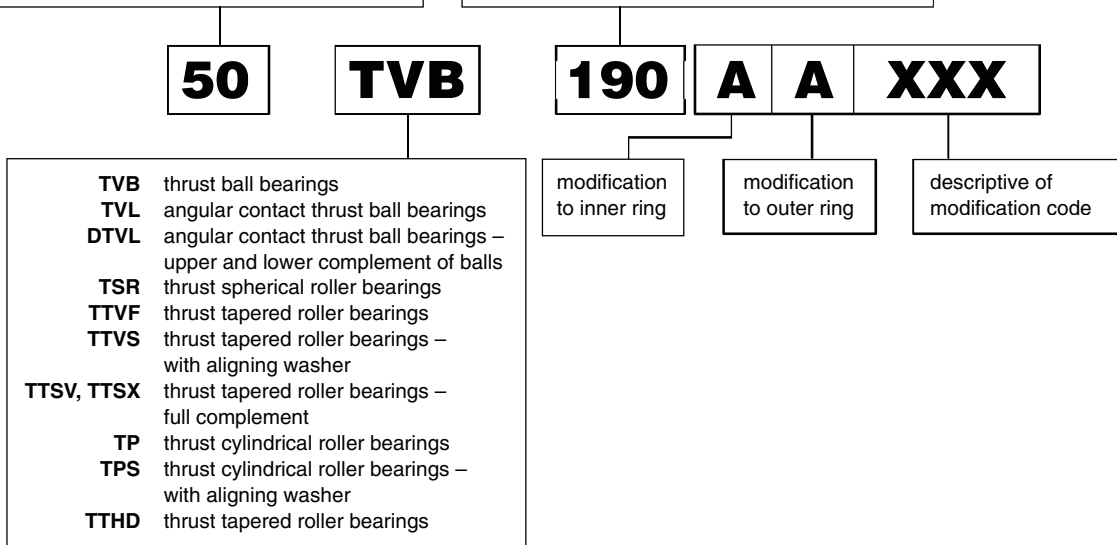

B

### Ball and Roller Thrust Bearings

From the three-digit "Series" number, it is known this is an inch size bearing. "50" is read as "5.0" and represents approximate or actual bore.

The series number (always three numerals) represents a specific size cage assembly.

## INTRODUCTION

Six basic designs of ball and roller thrust bearings are available: ball, cross roller, cylindrical, machine tapered (TTHD, V-Flat, Screwdown), stamped tapered and spherical tapered roller. Dimensional data for all styles are presented in order by bore size.

Engineering data such as tolerances, shaft and housing fits, and life and load rating calculations are found in the engineering section of this catalog.

B

## BEARING TYPES

### BALL THRUST BEARINGS

Ball thrust bearings provide optimum performance in high-speed installations, particularly where loads are generally lighter. Two types including axial (TVB), and angular contact (TVL) are available. The DTVL Type is offered with both an upper and lower complement of angular contact balls and three race elements. The standard tolerances for ball thrust bearings (both types) are equivalent to ABEC 1 where applicable. Higher precision tolerances are available. Consult your Timken representative for information on such installations.

#### TVB

TVB Types are separable, consisting of two hardened and ground steel washers. Precision ground and lapped balls run in a grooved raceway separated by a bronze cage. Other materials may be specified for the cage, depending on the application.

Most TVB bearings include washers of the same bore and outside diameter. Housings should be designed to clear the O.D. of rotating races, with shafts stepped to clear the bore of stationary washers. Provides axial rigidity, but are not suggested if radial load is expected. The TVB is exceptionally easy to mount with the rotating washer usually shaft mounted. The stationary washer should be housed with an outside diameter clearance that allows the bearing to assume a normal operating position.

TVB

#### TVL

TVL Types provide exceptionally low friction, are cool running and have quiet operation when operated at high speeds. They are also less sensitive to misalignment. Consult your Timken representative for assistance in determining limits of such loading for specific applications.

Although ball thrust bearings have been designed exclusively for thrust loads, the TVL bearing will accommodate some radial loading. Consult your Timken representative for assistance in determining the limits of such loading for specific applications.

Hardened and ground steel races of TVL bearings enclose a complement of precision ground and lapped steel balls, separated by a bronze cage. Other material may be specified as required.

Not strictly an annular ball bearing, the larger ring is identified as the outer ring; the smaller as the inner. Inner ring is usually the rotating element and is shaft mounted. Outer ring is normally stationary and should be mounted with an outside diameter clearance that allows the bearing to assume a normal operating position. If combined loads are expected, the outer ring must be radially located in the housing.

TVL bearings should always be operated under thrust loading. If a constant thrust load is not normally present, it should be imposed by springs or other devices.

TVL

#### DTVL

The DTVL has an upper and lower complement of angular contact balls and three race elements. It is capable of carrying thrust in one direction, comparable to the TVL Series and lighter thrust in the opposite direction.

DTVL

## SPHERICAL ROLLER THRUST BEARINGS

### TSR

A combination radial and thrust bearing designed to operate even if shaft and housing are, or become, misaligned under load. A favored bearing when conditions include heavy loads, difficulties in establishing or maintaining housing alignment or when shaft deflection can be expected.

Shaft deflections and housing distortions caused by shock or heavy loads (which lead to misalignment) are compensated for by the internal self-alignment of the bearing elements during operation. Corner loading of rollers, a condition that limits service life on other types of bearings, cannot develop in spherical roller thrust bearings.

The TSR achieves high thrust capacity and allows axial misalignment between the inner ring and the outer ring of up to  $\pm 2.5^\circ$ . Spherically contoured rollers, arranged in a steep angular position, not only accept high axial loads, but also moderate radial loads. "E" styles, (EM-machined bronze cage, EJ- stamped steel cage) have increased capacity. Should extreme conditions of loading and/or speed under misalignment be anticipated, contact your Timken representative before ordering.

The inherent compensation for misalignment, provided by the spherical roller bearings, offers the designer the opportunity to use weldments for housing frames instead of complex castings. This eliminates high-cost machining operations. When castings are preferred, bore alignment is less critical if spherical roller bearings are specified.

TSR

TSR-EJ

TSR-EM

## CYLINDRICAL ROLLER THRUST BEARINGS

Timken's cylindrical roller thrust bearings are designed to operate under heavy loads at moderate speeds. Standard versions can be operated at peripheral speeds (bearing O.D.) of up to 3000 feet per minute. Special design features are available for both the bearing and mounting permitting even higher rotational speeds for this type of bearing. Two types of cylindrical roller thrust bearings, TP and TPS, are available.

### TP

Type TP bearings include two flat hardened and ground steel washers with a cage retainer holding one or more controlled contour rollers in each pocket. If specifications call for two or more rollers per pocket, they are manufactured to different lengths. The longer rollers are placed in alternate positions in adjacent pockets. Overlapping roller paths prevent "grooving" of the races and prolong bearing life. Due to the simplicity of design, standard TP thrust bearings are among the most economical to buy and install.

Minor radial displacement of the races does not affect the operation of the TP bearing, resulting in manufacturing economies and simplified installation.

Shaft and housing seats must be square to the axis of rotation to prevent initial misalignment problems.

TP

### TPS

The TPS design is similar to the TP style, except the bottom washer assembly is comprised of two races, with the contacting faces spherically ground. The TPS bearing is self-adjusting to initial misalignment. It is not suggested for installations where alignment may be continuously changing (dynamic misalignment).

TPS

### TXR

The crossed roller bearing is ideal for machine tool applications such as vertical boring mills, vertical grinding machines and other similar applications. A crossed roller bearing is comprised of two sets of bearing races and rollers brought together at right angles to each other – with alternate rollers facing in opposite directions – and within a section height not much greater than that of a single bearing housing.

TXR

## ROLLER BEARINGS

### TAPERED ROLLER THRUST BEARINGS

Timken true rolling tapered roller thrust bearings include rollers that have conical sections. These bearings have been engineered so that the rollers and raceways form a cone in which the vertex is on the center line of the bearing. This bearing geometry assures a true rolling motion. In addition, the large end of each tapered roller is spherically ground so that its curvature conforms with the concave face of the washer rib. Pressure between the rib and roller, under load, guides the rollers accurately. Timken manufactures five types of tapered roller thrust bearings: standard (TTHD), V-Flat (TTVF) self-aligning V-Flat (TTVS), concave washer (TTSV), and convex washer (TTSX).

#### TTHD

The TTHD design has an identical pair of hardened and ground steel washers with tapered raceways. Both washers have the same bore and O.D., therefore housings should be designed to clear the O.D. of rotating washers and shafts stepped to clear the bore of stationary washers. Controlled contour tapered rollers are equally spaced by a cage. The TTHD bearing is well-suited for applications where extremely high thrust loads and heavy shock may be encountered as in crane hooks. For very low speed applications with unusually high loading, TTHD bearings can be supplied with a full complement of rollers. These bearings are identified in the tables by suffix 00278 following the bearing number. Applications for full-complement bearings should be reviewed by your Timken representative to ensure selection of the proper bearing.

TTHD

#### TTVF, TTVS, TTSV, TTSX

V-Flat Tapered Roller thrust bearings (TTVF and TTVS) combine the outstanding features of tapered thrust and cylindrical roller bearings, offering the highest possible capacity of any thrust bearing of its size. The V-Flat design includes one flat washer and one with a tapered raceway matching the rollers. The design was originally developed for screwdown applications in metal rolling mills where thrust loads exceeding one million pounds are common. The V-Flat bearings have exceptional dynamic capacity within a given envelope and provides static capacity. They have been highly successful in heavily loaded extruders, in cone crushers and other applications where a wide range of operating conditions are found. Most sizes utilize cages with hardened pins through the center of the rollers, allowing closer spacing of the rollers to maximize capacity.

Smaller sizes have brass cages, designed for unidirectional retention of rollers.

Both the pin type and brass cage are designed to permit a full flow of lubricant to all critical surfaces, providing cooler operation.

Self-aligning V-Flat bearings (TTVS) employ the same basic roller and raceway design, except the lower washer is in two pieces, with the contacting faces spherically ground permitting self-alignment under conditions of initial misalignment. TTVS bearings should not be used if dynamic misalignment (changing under load) is expected.

- The contact surface of each roller of the V-Flat bearings has a controlled contour wherein the ends are slightly relieved. This optimizes stress distribution by avoiding concentration of stress in the raceways at the ends of the rollers.
- Conformity between roller end and the rib is controlled to enhance the flow of lubricant between these surfaces, allowing the development of a hydrodynamic oil film between the end of the roller and the guiding surface of the rib.
- Full roller complement designs (TTSV and TTSX) do not have conventional bores, but are provided with center inserts for attachment purposes as well as for lifting.
- The TTSV and TTSX designs offer the highest capacity but at a somewhat reduced speed capability as compared with other V-Flat types.
- The TTSV and TTSX bearings encompass tapered rollers between two raceways. One raceway is flat and the other raceway forms the surface of a cone. The conical raceway has a washer with a rib to resist the radial component of the thrust force caused by the inclined plane and to guide the rollers.

TTVF

TTVS

TTSV

TTSX

B

- Lines extended from the TTSV and TTSX roller-to-raceway contact surfaces converge to form a cone. The vertex of this cone is common with the centerline of the bearing and the plane of the raceway surface of the flat washer.
- The TTSV and TTSX design achieves true rolling motion between the tapered rollers and both raceways with no sliding or skidding at any point on the rolling surfaces. The flat raceway permits radial displacement without affecting the operation of the bearing.

### TTSP

The types TTSP and TTSPS (not shown) thrust bearings are made up of two tapered thrust races, rollers, cage and outside retainer which holds the components together during shipping and installation. The types TTSP and TTSPS thrust bearings are employed extensively in the steering pivot positions of automotive and industrial applications.

### TTC, TTCS

The types TTC, TTCS and TTCL (not shown) thrust bearings consist of two tapered thrust races, rollers and an outside retainer and are cageless. The outside retainer holds the assembly together for shipping and installation. Types TTC, TTCS and TTCL bearings are thrust bearings specifically designed for oscillating applications. These types are identical with the exception of the retainer construction.

B

# ROLLER BEARINGS

## BALL THRUST BEARINGS

### TYPE TVB

- Designed for optimum performance in high speed installations.
- Provide axial rigidity, but are not suggested if radial loading is expected.
- Exceptionally easy to mount, with the rotating washer usually shaft-mounted.

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.

## ANGULAR CONTACT BALL THRUST BEARINGS

### TYPE TVL

- Provides exceptionally low friction, cool running and quiet operation when run at high speeds.
- Although designed exclusively for thrust loads, will accommodate some radial loading.

### DIMENSIONS – LOAD RATINGS<sup>(2)</sup>

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.

<sup>(2)</sup> See engineering section for application of Equivalent Thrust Load Factors: X = 0.76, Y = 1.00,  $\frac{T}{R}$  (min) = 1.56.  $\left[\frac{T}{R}\right]$  is Thrust Load ÷ Radial Load

# ROLLER BEARINGS

## ANGULAR CONTACT BALL THRUST BEARINGS

### TYPE DTVL

- Capable of carrying thrust in one direction, plus a lighter thrust in the opposite direction.
- Designed with an upper and lower complement of angular contact balls and three race elements.

B

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.

<sup>(2)</sup> See engineering section for application of Equivalent Thrust Load Factors:  $X = 0.76, Y = 1.00, \frac{T}{R} (\min) = 1.56, \left[ \frac{T}{R} \right]$  is Thrust Load ÷ Radial Load

## SPHERICAL ROLLER THRUST BEARINGS

### TYPE TSR

- Design achieves a high thrust capacity with low friction and continuous roller alignment.
- Spherically contoured rollers, arranged in steep angular position, not only accommodates high thrust loads, but supports moderate radial loads as well.
- Low friction of the bearing results from a combination of bearing geometry and manufacturing technology.

### TYPE TSR-EM

- Utilize bronze retainers and enhanced internal geometry allowing for higher dynamic load ratings and improved lubrication characteristics.
- Utilizes spherically contoured rollers arranged in a steep angular configuration to accommodate high thrust load alone or in combination with moderate radial loads.
- Possesses inherent dynamic misalignment capabilities.

### DIMENSIONS – LOAD RATINGS

(1) Maximum shaft or housing fillet radius that bearing corners will clear.  
 (2) Centrifugal force constant. See engineering section for calculations using this factor.

## CYLINDRICAL ROLLER THRUST BEARINGS

### TYPE TP

- Most economical to buy and install because of design simplicity.
- Minor radial displacement of the races does not affect its operation, resulting in manufacturing economies and simplified installation.

### DIMENSIONS – LOAD RATINGS

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.

## CYLINDRICAL ROLLER THRUST BEARINGS

### TYPE TPS

- Similar to Type TP except one washer is spherically ground to seat against an aligning washer. This makes it adaptable to initial misalignment.
- Not suggested for operating conditions where alignment is constantly changing.

### DIMENSIONS – LOAD RATINGS

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.

## CROSSED ROLLER THRUST BEARINGS

### TYPE XR AND JXR

- Withstands high overturning moments.
- Applications include machine tool table bearing for vertical boring and grinding machines. Other applications include various pivot and pedestal applications.
- Dimensions given in the following table relate to bearing type TXRDO, which is the most common form of crossed roller bearing.
- TXRDO bearing has a double outer race and two inner races with rollers spaced by separators.
- Other mounting configurations and sizes of crossed roller bearing can be supplied to meet particular assembly or setting requirements.
- Contact your Timken representative for more information.

### DIMENSIONS – LOAD RATINGS

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.

<sup>(2)</sup> Centrifugal force constant. See engineering section for calculations using this factor.

# ROLLER BEARINGS

## TAPERED ROLLER THRUST BEARINGS

### TYPE TTHD

- Consists of two tapered thrust races, rollers and cage.
- All components are separable.
- Generally a heavy-duty bearing and can operate at a relatively high speed.
- Extensively used in numerous applications including oil well swivels, pulp refiners, extruders and piercing mill thrust blocks.

| Bearing Number  | Fig No. | Bore    |         | Outside Diameter |      | Width |        | Shaft Fillet Radius |        | Housing Fille Radius |  | Mass | Remarks                                             |

## TAPERED ROLLER THRUST BEARINGS

### TYPE TTVF

- Combines the outstanding features of tapered thrust and cylindrical roller bearings to offer the highest possible capacity of any thrust bearing of its size.
- One washer is perfectly flat, while the second includes a tapered raceway matching the rollers.
- Originally developed for screwdown applications in metal rolling mills where thrust loads exceeding one million pounds are common.

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.

# ROLLER BEARINGS

## TAPERED ROLLER THRUST BEARINGS

### TYPE TTVS

- Same basic roller and raceway design as the TTVF except that the lower washer is two pieces to permit self-alignment under conditions of initial misalignment.

### DIMENSIONS – LOAD RATINGS

<sup>(1)</sup> Maximum shaft or housing fillet radius that bearing corners will clear.

## TAPERED ROLLER THRUST BEARINGS

### TYPE TTSX

- A full roller complement design without a conventional bore.
- Supplied with center inserts for attachment purposes as well as for lifting.
- Offers the highest capacity but at a somewhat reduced speed capability, as compared with other V-Flat types.

# ROLLER BEARINGS

## TAPERED ROLLER THRUST BEARINGS

### TYPE TTSV

- Designed with a full complement of controlled contour rollers without a conventional bore.
- Supplied with center inserts for attachment purposes as well as for lifting.
- Offers the highest capacity but at a somewhat reduced speed capability, as compared with other V-Flat types.

## TAPERED ROLLER THRUST BEARINGS

### TYPE TTSP

- The types TTSP and TTSPS (not shown) thrust bearings are made up of two tapered thrust races, rollers, cage and outside retainer which holds the components together during shipping and installation.
- These bearings are employed extensively in the steering pivot positions of automotive and industrial applications.

## TAPERED ROLLER THRUST BEARINGS

### TYPE TTC-TTCS

- The types TTC, TTCS and TTCL (not shown) thrust bearings consist of two tapered thrust races, rollers and an outside retainer and are cageless.
- The outside retainer holds the assembly together for shipping and installation.
- These thrust bearings are specifically designed for oscillating applications.
- These types are identical with the exception of the retainer construction.

## **ROLLER BEARINGS**

### **NOTES**

**B**

# AUXILIARY PARTS

## CUP SHIMS

### STANDARD METAL SHIMS FOR CUP ADJUSTMENT BEARINGS

Shims 0.13 mm (0.005 in.), 0.18 mm (0.007 in.) and 0.51 mm (0.020 in.) thick.

Without carrier

With carrier  
Carrier section should be equal to average cup wall section.

Suggested shim sets consist of three 0.13 mm (0.005 in.), three 0.18 mm (0.007 in.), and one 0.51 mm (0.020 in.) thick shims. When ordering, specify the exact quantity for each part number. Shims shown in this table are made from aluminum, brass, or steel shim stock.

THESE PARTS HAVE BEEN DESIGNED AND DEVELOPED FOR USE WITH TIMKEN BEARINGS ONLY.

# AUXILIARY PARTS

## CUP SHIMS

### STANDARD METAL SHIMS FOR CUP ADJUSTMENT BEARINGS

B

Shims 0.13 mm (0.005 in.), 0.18 mm (0.007 in.) and 0.51 mm (0.020 in.) thick.

Without carrier

With carrier  
Carrier section should be equal to average cup wall section.

Suggested shim sets consist of three 0.13 mm (0.005 in.), three 0.18 mm (0.007 in.), and one 0.51 mm (0.020 in.) thick shims. When ordering, specify the exact quantity for each part number. Shims shown in this table are made from aluminum, brass, or steel shim stock.

## CONE SHIMS

### STANDARD METAL SHIMS FOR CONE ADJUSTED BEARINGS

Suggested shim sets consist of three 0.13 mm (0.005 in.), three 0.18 mm (0.007 in.), and one 0.51 mm (0.020 in.) thick shims. When ordering, specify the exact quantity for each part number.

Shims shown in this table are made from aluminum, brass, or steel shim stock.

| Shims       |               | Shaft Size    | Cap Screws |              | d <sub>1</sub> | d <sub>2</sub> | d <sub>3</sub> | Shims       |               | Shaft Size    | Cap Screws |              | d <sub>1</sub> | d <sub>2</sub> | d <sub>3</sub> |
|-------------|---------------|---------------|------------|--------------|----------------|----------------|----------------|-------------|---------------|---------------|------------|--------------|----------------|----------------|----------------|

THESE PARTS HAVE BEEN DESIGNED AND DEVELOPED FOR USE WITH TIMKEN BEARINGS ONLY.

### LOCKNUTS, LOCKWASHERS AND TONGUED WASHERS

#### STANDARD LOCKNUTS, LOCKWASHERS AND TONGUED WASHER ASSEMBLIES

Figure 1

Figure 2

Figure 3

Figure 4

Figure 5

Figure 6

The designs shown in figures 1 to 6 show various methods of using standard locknuts, lockwashers, and tongued washers. A single locknut and lockwasher can be used to clamp the cone against a sleeve, shown in figure 1, or directly against a shaft shoulder. A narrow spacer is applied between the front face of the cone and the lockwasher so that the lockwasher will clear the bearing cage by a minimum of 3 mm (0.12 in.). The spacer outside diameter should be made a minimum of 6 mm (0.24 in.) smaller than the cage inside diameter, but must still provide the suggested cone backing diameter. Figure 2 shows another clamped design using a single locknut and lockwasher with a two-row bearing of either type TD0 with cone spacer or type TNA. Since no cage clearance problem is present, the narrow spacer shown in figure 1 is unnecessary.

Figures 3, 4, and 5 indicate an adjustable bearing arrangement using two locknuts and a lockwasher. These may be used with either single or two-row bearing of the types permitting a cone adjusted arrangement. The design in figure 3 allows the maximum shaft extension diameter that can be used with a shaft thread

outside diameter, which will be less than the cone bore. Figure 4 shows an alternate design with smaller thread diameter and corresponding smaller locknuts and lockwasher. The locknut outside diameter, minus 2 times "r", must not be less than the suggested cone backing diameter. Figure 5 indicates the use of a tongued washer located between the inner locknut and cone. This is intended for applications where the cones are applied with loose fits on hardened stationary shafts as found in many automotive applications. The hardened tongued washers are not sold by The Timken Company.

When space does not permit the use of two locknuts and a lockwasher in an adjustable arrangement, and a single locknut and a lockwasher is used, then a tongued washer must be placed between the cone and lockwasher as illustrated in figure 6. This is necessary to provide adequate backing for the cone, in most cases, and to prevent damage to the lockwasher if the cone should creep on the shaft. The tongued washers are available from The Timken Company.

## LOCKNUTS, LOCKWASHERS AND TONGUED WASHERS - INCHES

### STANDARD LOCKNUTS, LOCKWASHERS AND TONGUED WASHERS FOR TAPERED ROLLER BEARINGS

Figure 1 - LOCKNUTS

Figure 2 - LOCKWASHERS

Figure 3 - TONGUED WASHERS

Threads are American National, Form NS, Class 3, with thread length based on 45° chamfer.

DIMENSIONS ARE IN INCHES

| ABMA Locknut Number | Locknut Dimensions              |               |                       |                |                            |       | Lockwasher Dimensions  |                                  |                    |                |                 | Tongued Washer Dimensions |           |       |                       |                |           |           |

## LOCKNUTS, LOCKWASHERS AND TONGUED WASHERS

### SHAFT THREAD AND KEYWAY DIMENSIONS FOR STANDARD LOCKNUTS, LOCKWASHERS AND TONGUED WASHERS

These dimensions are ABMA standards.

DIMENSIONS ARE IN INCHES

| ABMA Locknut Number | Number Per Inch | threads        |         |        |                    |        |        |                  | Minor Dia.     | Relief Diameter A | Relief Width W +0.016 0.000 | Shaft Ext. Dia. V2 Max. | Thread Length    |              | Keyway                |                |                 |  |
|---------------------|-----------------|----------------|---------|--------|--------------------|--------|--------|------------------|----------------|-------------------|-----------------------------|-------------------------|------------------|--------------|-----------------------|----------------|-----------------|--|

## NEEDLE ROLLER AND CAGE RADIAL ASSEMBLIES

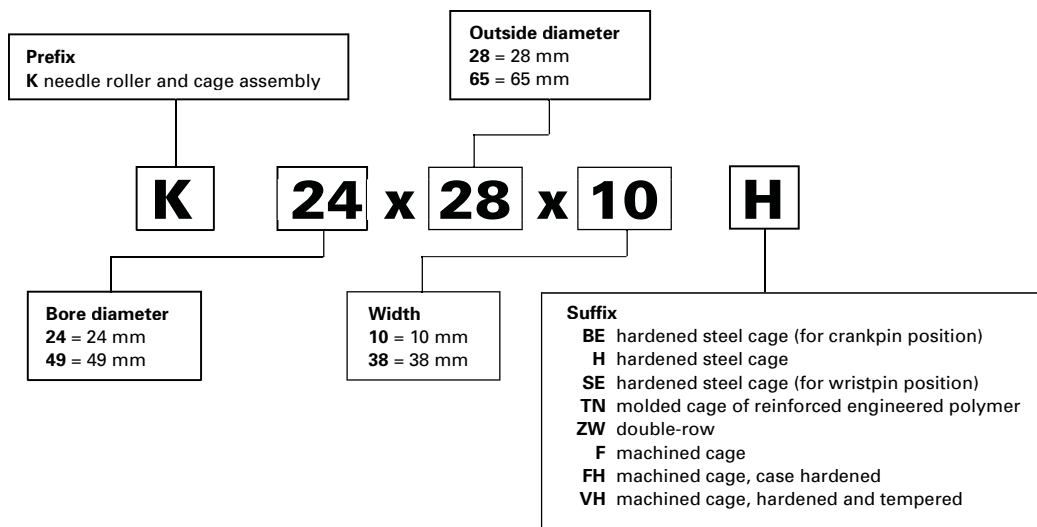

**Overview:** Needle roller and cage assemblies are a complement of needle rollers held in place by a cage. The mating shaft and housing are normally used as inner and outer raceways. The unitized design allows for easy handling and installation. Controlled-contour rollers reduce end stresses and permit operation under moderate misalignment. A variety of cage designs, styles and materials, as well as multiple roller paths and segmented constructions, meet broad application requirements.

- **Sizes:** 6 mm - 150 mm bore.
- **Markets:** Automotive and truck transmissions, agricultural and construction equipment, two-cycle engines, pumps and compressors.
- **Features:** Special coatings and platings; split and segmented designs for simplified mounting; engineered polymer cages.
- **Benefits:** High load capacity and high limiting speed within the smallest envelope.

# NEEDLE ROLLER BEARINGS

## NEEDLE ROLLER AND CAGE RADIAL ASSEMBLIES

### METRIC SERIES

Timken® Torrington® metric series needle roller and cage radial assemblies are available in a variety of sizes and designs. This catalog includes the most popular, standardized and non-standard designs.

### REFERENCE STANDARDS ARE:

- **ISO 3030** – Needle roller bearings – Needle roller and cage radial assemblies – Boundary dimensions and tolerances
- **DIN 5405 Part 1** – Rolling bearings – needle bearings – Radial needle roller and cage assemblies.
- **ANSI/ABMA 18.1** – Needle roller bearings – Radial, metric design.

Before selecting specific metric series needle roller and cage radial assemblies, the engineering section of this catalog should be reviewed.

### Types of Metric Series Needle Roller and Cage Radial Assemblies

#### Suffixes

|             |                                                             |
|-------------|-------------------------------------------------------------|
| <b>TN</b>   | molded cage of reinforced engineered polymer                |
| <b>ZW</b>   | double - row                                                |
| <b>TNZW</b> | molded cage of reinforced engineered polymer – double - row |
| <b>H</b>    | hardened steel cage                                         |
| <b>F</b>    | machined cage                                               |
| <b>FH</b>   | machined cage, case hardened                                |
| <b>FV</b>   | machined cage, hardened and tempered                        |

### CONSTRUCTION

Needle roller and cage radial assemblies have a steel cage that provides both inward and outward retention for the needle rollers. The designs provide maximum cage strength consistent with the inherent high load ratings of needle roller bearings. Accurate guidance of the needle rollers by the cage bars allows for operation at high speeds. Needle roller and cage assemblies have either one or two rows of needle rollers.

Also listed are metric series needle roller and cage assemblies using molded, one piece glass reinforced engineered polymer cages (suffix TN). These operate well at temperatures up to

120° C over extended periods. However, care should be exercised when these assemblies are lubricated with oils containing additives as service life may be reduced if the operating temperature exceeds 100° C. At such high temperatures oil can deteriorate with time and it is suggested that oil change intervals are observed.

Needle rollers with relieved ends used in these assemblies are made of high carbon chrome steel, through-hardened, ground and lapped to close tolerances for diameter and roundness. See the engineering section of this catalog for further discussion of relieved end rollers.

## DIMENSIONAL ACCURACY

### NEEDLE ROLLER GROUPS (GAGES)

Metric series needle roller and cage radial assemblies are supplied with needle roller complements subdivided into groups (gages) shown in Table 1. The groups are at Timken's option if nothing to the contrary is agreed upon at the time of ordering. This is in accordance with Grade G2 specified in ISO 3096 standard (see needle rollers, page C326). The group limits of the needle rollers are indicated on the package. Labels of identifying colors show the group limits of the needle rollers. The needle roller and cage assemblies of one shipment usually contain needle rollers with group limits of between 0 to -2, and -5 to -7 mm (colors red, blue and white). Information on needle roller and cage assemblies with needle rollers of different group limits will be supplied on request.

TABLE 1 – NEEDLE ROLLER GROUP LIMITS (GRADE G2)

| Group | Tolerance<br>µm | Marking | Identifying color of label<br>or on package |
|-------|-----------------|---------|---------------------------------------------|
| 0     | -2              | P0M2    |                                             |
| -1    | -3              | M1M3    | red                                         |
| -2    | -4              | M2M4    |                                             |
| -3    | -5              | M3M5    | blue                                        |
| -4    | -6              | M4M6    |                                             |
| -5    | -7              | M5M7    | white (gray)                                |
| -6    | -8              | M6M8    |                                             |
| -7    | -9              | M7M9    | green                                       |
| -8    | -10             | M8M10   |                                             |
| -9    | -11             | M9M11   | yellow                                      |

In the marking of the gages, P identifies zero (0) or plus (+), M identifies minus (-).

## MOUNTING DIMENSIONS

### DESIGN OF RACEWAYS

Needle roller and cage radial assemblies use the housing bore as the outer raceway and the shaft as the inner raceway. In order to realize full bearing load rating and life the housing bore and the shaft raceways must have the correct geometric and metallurgical characteristics. The housing should be of sufficient cross section to maintain adequate roundness and running clearance under load. Additional design details for housings and shafts used as outer and inner raceway can be found in the engineering section of this catalog. The only limit to precision of the radial clearance of a mounted assembly is the capability of the user to hold close tolerances on the inner and outer raceways. The suggested shaft tolerances listed in Table 2 are based on housing bore tolerance G6 and apply to metric series radial needle roller and cage assemblies with needle rollers of group limits between P0M2 and M5M7.

TABLE 2 – SUGGESTED SHAFT TOLERANCES FOR HOUSING BORES MACHINED TO G6

| Nominal shaft diameter in mm | ≤ 80            | > 80 |
|------------------------------|-----------------|------|
|                              | SHAFT TOLERANCE |      |
| smaller than normal          | j5              | h5   |
| normal                       | h5              | g5   |
| larger than normal           | g6              | f6   |

### AXIAL GUIDANCE REQUIREMENTS

Needle roller and cage radial assembly must be axially guided by shoulders or other suitable means. The end guiding surfaces should be hardened to minimize wear and must provide sufficient axial clearance to prevent end locking of the assembly. Length tolerance H11 is suggested.

If end guidance is provided by a housing shoulder at one end and by a shaft shoulder at the other end the shaft must be axially positioned to prevent end locking of needle roller and cage assembly. The housing and shaft shoulder heights should be 70 to 90 percent of the needle roller diameter to provide proper axial guidance.

### MOUNTING IN SETS

Needle roller and cage radial assemblies that are mounted side by side must have needle rollers of the same group limits to ensure uniform load distribution.

## LUBRICATION

Oil is the preferred lubricant for most applications. In critical applications involving high speeds, ample oil flow must be provided. Where assemblies are subjected to high centrifugal forces, such as in epicyclic gearing, or inertia forces as in the small end of a connecting rod, the contact pressure between the cage and the raceway guiding surface becomes critical. The allowable contact pressure depends on a combination of the induced force and the rubbing velocity between the cage and raceway and the rate of lubricant flow. Consult your Timken representative when cages will be subjected to high induced forces.

## SPECIAL DESIGNS

Needle roller and cage radial assemblies made to special dimensions or configurations, such as those which are split to assemble around a one piece crankshaft, can be made available on special order. Special coated or plated cages to enhance life under conditions of marginal lubrication and high induced forces can also be made available.

## NEEDLE ROLLER BEARINGS

### NEEDLE ROLLER AND CAGE RADIAL ASSEMBLIES FOR CONNECTING ROD APPLICATIONS – METRIC SERIES

Connecting rods have two bearing positions: the crank pin or big end and the wrist pin or small end.

In the crank pin position there may be severe operating conditions due to centrifugal forces, internal forces, accelerations and high rotational speeds, requiring the use of special needle roller and cage radial assemblies.

Similarly, in the wrist pin position the reciprocating inertia loads and high oscillating speeds dictate the use of special cage designs.

## CONSTRUCTION

### METRIC SERIES NEEDLE ROLLER AND CAGE RADIAL ASSEMBLIES FOR CRANK PIN POSITIONS

Needle roller and cage assemblies for use in crank pin positions have cages with a large outside cylindrical surface to ensure optimum radial guidance in the connecting rod bore. Due to the inherent low weight and strength of the heat-treated cages, the needle roller and cage assemblies are well-suited for high engine speed applications. When necessary, silver plating and copper plating can be applied for optimum performance during operation at high speeds.

### METRIC SERIES NEEDLE ROLLER AND CAGE RADIAL ASSEMBLIES FOR WRIST PIN POSITIONS

Reciprocating inertia loads and oscillating speeds require the cages used in the wrist pin positions to be heat treated and to guide on the wrist pin.

These cages are available in a variety of widths to allow the selection of a needle roller and cage assembly with the length of needle rollers to match the connecting rod width.

### SIZE SELECTION

In most instances selection of a suitable size of a needle roller and cage assembly for typical connecting rod positions may be based on the cylinder displacement of the engine which in turn, dictates the crank pin and wrist pin diameters.

Suggestions based on engine displacements are listed in the following table.

TABLE 1 – CRANK PIN AND WRIST PIN DIAMETERS, DETERMINED BY THE CYLINDER DISPLACEMENT OF THE ENGINE.

| CYLINDER DISPLACEMENT IN CM <sup>3</sup> |   |    |    |     |     |     |     |     |
|------------------------------------------|---|----|----|-----|-----|-----|-----|-----|
| Cylinder                                 | > |    | 40 | 60  | 100 | 150 | 200 | 300 |
| Displacement                             | ≤ | 40 | 60 | 100 | 150 | 200 | 300 |     |

| DIAMETER IN MM |  |       |          |       |          |          |       |       |
|----------------|--|-------|----------|-------|----------|----------|-------|-------|
| Crank pin      |  | 12/14 | 15/16/18 | 18/20 | 18/20/22 | 24/25/28 | 28/30 | 35/40 |
| Wrist pin      |  | 10/11 | 12/13    | 14/15 | 15/16    | 18       | 20    | 20    |

### Suitable Materials and Heat Treatment

Connecting rod crank pin end and wrist pin end bores serve as raceways:

a case hardening steel such as 15 CrNi 6, 17 MnCr 5 or AISI 8620.

Crank pins:

e.g., case hardening steel 15 Cr 3, AISI 8620, AISI 1018 or through-hardening steel 100 Cr 6, AISI 52100.

Wrist pins:

e.g., case hardening steel Ck 15, 15 Cr 3 or through-hardening steel 100 Cr 6, AISI 52100.

The effective case depth (50 HRC) of the raceways should be 0.5 mm minimum, the surface hardness should be 60 HRC or 700 HV minimum.

After hardening, the connecting rods must be stress relieved.

The connecting rod raceway bores as well as the crank pins and the wrist pins must be precision ground or preferably honed to a surface finish  $R_a$  not exceeding 0.16  $\mu\text{m}$ .

### FORM TOLERANCES

The form tolerances for crank pins, wrist pins and connecting rod bores are listed in Table 2.

TABLE 2 – FORM TOLERANCES

|                            |                       | Dimension in mm             |    |     |     |     |
|----------------------------|-----------------------|-----------------------------|----|-----|-----|-----|
| Nominal pin diameter       | >                     | 10                          | 14 | 18  | 25  | 30  |
|                            | ≤                     | 14                          | 18 | 25  | 30  | 40  |
|                            |                       | Tolerances in $\mu\text{m}$ |    |     |     |     |
| Parallelism*               | wrist pin & crank pin | 1                           | 1  | 2   | 2   | 3   |
|                            | rod bore              | 2                           | 3  | 3   | 4   | 4   |
| Circularity (DIN ISO 1101) | wrist pin & crank pin | 1                           | 1  | 1.5 | 1.5 | 2   |
|                            | rod bore              | 1.5                         | 2  | 2   | 2.5 | 2.5 |

\* The parallelism values are valid for the needle roller length  $L_w$ .

It is suggested that the parallelism of the wrist pin axis and the crank pin axis be within a tolerance zone of 0.03 mm diameter over a distance of 100 mm.

## RADIAL CLEARANCE

### METRIC SERIES CRANK PIN BEARINGS

The high speeds of modern production engines dictate the need for crank pin bearings with a relatively large radial clearance. As an approximation, the minimum clearance can be taken as the crank pin diameter/1000. The maximum radial clearance would be a result of the sorting plan shown in Table 3.

As shown in the example of the matching scheme, the suggested mounting diameters for the crank pin position are G6 for the connecting rod bore diameters and h5 for the crank pin diameters. Axial location of the cage is shown on the crank pin end guidance arrangement.

Racing and sport engines operate at yet even higher speeds than production engines, requiring 50 percent larger radial clearances in the crank pin bearings. The larger radial clearances should also be used in bores of split connecting rods to avoid the danger of distortion resulting from the unavoidable connecting rod deformation occurring in operation. Consult your Timken representative for advice on such applications.

### METRIC SERIES WRIST PIN BEARINGS

The radial clearance in wrist pin bearings should be held as small as possible. The minimum clearance should be aimed at 2 mm with the maximum clearance resulting from the proposed sorting plan in Table 3. The maximum clearance should be held as close as possible to 12 mm for all wrist pin bearings based on sorting wrist pins made to a tolerance h5, small end bore diameter tolerance of K6 and needle roller grades as shown in Table 3.

## NEEDLE ROLLER AND CAGE RADIAL ASSEMBLIES

### INCH SERIES

Timken® Torrington® inch series needle roller and cage radial assemblies are available in a variety of sizes and designs. This catalog includes the most popular standard designs.

#### REFERENCE STANDARDS:

- **ANSI/ABMA 18.2** – Needle roller bearings – Radial, inch design.

Before selecting specific inch series, needle roller and cage radial assemblies, the engineering section of this catalog should be reviewed.

### Types Of Inch Series Needle Roller And Cage Radial Assemblies

WJ

WJC

There are two primary constructions of inch series needle roller and cage assemblies. The WJ assemblies generally employ larger diameter needle rollers whereas the WJC assemblies normally employ smaller diameter needle rollers.

### CONSTRUCTION

Needle roller and cage radial assemblies have a steel cage which provides both inward and outward retention for the needle rollers. The designs provide maximum cage strength consistent with the inherent high load ratings of needle roller bearings.

Accurate guidance of the needle rollers by the cage bars allows for operation at high speeds. Needle roller and cage assemblies have either one or two rows of needle rollers.

Also available (on request) are needle roller and cage assemblies using molded, one piece glass reinforced engineered polymer cages. These operate well at temperatures up to 250° F (120° C) over extended periods. However, care should be exercised when bearings are lubricated with oils containing additives as service life may be reduced if the operating temperature exceeds 212° F (100° C). At such high temperatures oil can deteriorate with time and it is suggested that oil change intervals are observed.

Needle rollers with relieved ends used in these assemblies are made of high carbon chrome steel, through-hardened, ground and lapped to close tolerances for diameter and roundness. See the engineering section of this catalog for further discussion of relieved end rollers.

### DIMENSIONAL ACCURACY

The nominal inch assemblies, WJ and WJC, contain needle rollers manufactured to only one diameter grade. Within any one assembly, the needle rollers have a total diameter tolerance of .0001 inch.

The limit to precision of the radial clearance of mounted needle roller and cage assemblies is the capability of the user to hold close tolerances on the inner and outer raceways.

The tolerance of the overall width of these assemblies is given on the tabular pages of this section.

### MOUNTING DIMENSIONS

The cage and needle roller assembly normally uses the shaft and housing as the inner and outer raceways. In order to realize full bearing load rating and life, the shaft and housing must have the correct geometric and metallurgical characteristics.

The tables of dimensions for these assemblies list the suggested diameters for the shaft when used as the inner raceway. These are consistent with ISO h5 shaft raceway tolerances. Additional design details for shafts used as inner raceways can be found in the engineering section of this catalog.

Since the housing normally serves as the outer raceway, it should be of sufficient cross section to maintain adequate roundness and running clearance under load. The tables of dimensions also list the suggested diameters for the housings when used as outer raceways. These are consistent with ISO G6

## NEEDLE ROLLER BEARINGS

housing bore tolerances. Additional design details for housings used as outer raceways can be found in the engineering section of this catalog.

The suggested mounting diameter tolerances for these needle roller and cage assemblies will provide correct running clearance for most applications.

The needle roller and cage assembly must be axially located by shoulders or other suitable means. End locating surfaces should be hardened to minimize wear. For satisfactory operation, minimum axial clearance should be 0.008 inch. When using type WJ assembly, fillets adjacent to the assembly must not exceed 0.03 inch radius. When it is necessary to use fillets adjacent to WJC assembly, please consult your Timken representative for suggestions.

### LUBRICATION

Oil is the preferred lubricant for most applications. In critical applications involving high speeds, ample oil flow must be provided. Where assemblies are subjected to high centrifugal forces, such as in epicyclic gearing, or inertia forces, as in the small end of a connecting rod, the contact pressure between the cage and the raceway guiding surface becomes critical. The allowable contact pressure depends on a combination of the induced force and the rubbing velocity between the cage and the raceway and the rate of lubricant flow. Consult your Timken representative when cages will be subjected to high induced forces.

### SPECIAL DESIGNS

Needle roller and cage assemblies made to special dimensions or configurations, such as those that are split to assemble around a one-piece crankshaft, can be made available on special order where quantities permit. Special plated cages to enhance life under conditions of high induced forces can also be made available.

C

SINGLE-ROW ASSEMBLIES

INCH SERIES

Load Ratings are based on a minimum raceway hardness of 58 HRC or equivalent.

Minimum axial clearance should be .02 mm, .008 in.

Load Ratings are based on a minimum raceway hardness of 58 HRC or equivalent.

Minimum axial clearance should be .02 mm, .008 in.

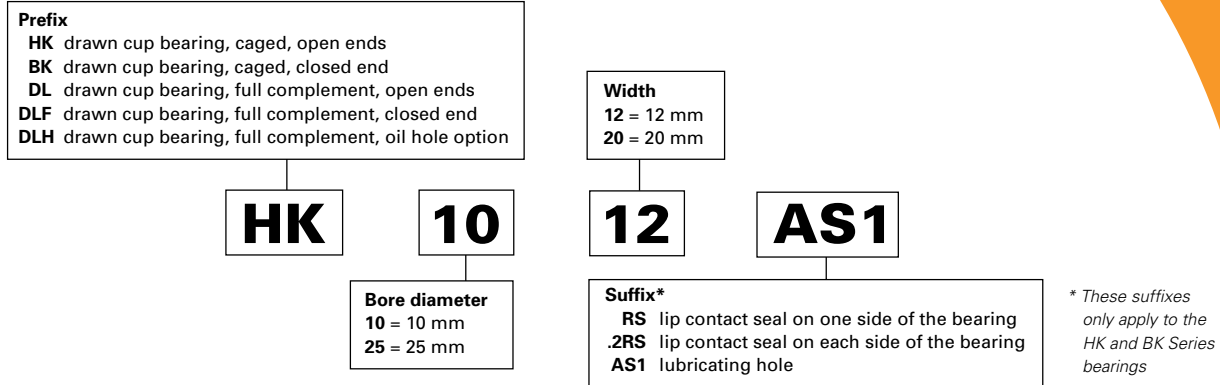

## DRAWN CUP NEEDLE ROLLER BEARINGS

**Overview:** Drawn cup needle roller bearings support radial loads and reduce friction between rotating components, with a drawn outer shell serving as a raceway for the rollers. The low cross section of the drawn cup bearing provides high load-carrying capability with minimum required space. Drawn cup bearings are easily installed with a press fit in the housing.

- **Sizes:** 3 mm - 60 mm bore (1/8 in. - 5 1/2 in. bore).
- **Markets:** Transmissions, transfer cases, engines, valve trains, steering and braking systems, axle supports, outboard engines, power tools, copiers, fax machines, paper-moving equipment and appliances.
- **Features:** Available in two basic designs: full complement and caged.
- **Benefits:** Full complement handles high radial load-carrying capability at a low cost. Caged provides high speed and maximum lubricant retention capability.

## NEEDLE ROLLER BEARINGS

### DRAWN CUP NEEDLE ROLLER BEARINGS

#### METRIC SERIES

When a rolling bearing is needed for a compact and economic design and where it is not practical to harden and grind the housing bore, or where the housing materials are of low rigidity such as cast iron, aluminum or even plastics, drawn cup needle roller bearings should be considered.

#### REFERENCE STANDARDS ARE:

- **ISO 3245** – Rolling bearings – Needle roller bearings, drawn cup, without inner ring, boundary dimensions and tolerances.
- **ANSI/ABMA 18.1** – Needle roller bearings – Radial, metric design.
- **DIN 618** – Needle roller bearings with cage – Drawn cups with open end, drawn cup with closed end.

Before selecting specific drawn cup needle roller bearings, the engineering section of this catalog should be reviewed.

#### Types Of Metric Series Drawn Cup Needle Roller Bearings

Drawn cup needle roller bearing, open ends

HK

Drawn cup needle roller bearing, closed end

BK

Drawn cup needle roller bearings, open ends, sealed

HKRS

HK.2RS

#### Suffixes

|      |                  |
|------|------------------|
| AS1  | lubricating hole |
| RS   | one seal         |
| .2RS | two seals        |

### CONSTRUCTION

The prefix letters in metric series drawn cup bearing designations denote whether the bearings are made with a full complement of needle rollers or caged needle rollers. The use of a full complement of needle rollers is indicated by the prefix code letters DL or DLF and for use of caged needle rollers by the prefix code letters HK or BK.

The outer ring, in the form of a cup, is accurately drawn and no subsequent machining is performed. Drawn cup needle roller bearings of series HK and DL have open ends. The HK Series are also available with one seal, HKRS, and with two seals, HK.2RS. The stamped lip of a drawn cup needle roller bearing of series HKRS with one seal is at the seal end.

Drawn cup needle roller bearings of series BK and DLF are closed at one end. They are used for shaft end mounting. The open end is not sealed.

The one-piece steel cage used in HK Series drawn cup bearings is designed to provide rigidity and minimize wear. This cage design separates the needle roller guiding and retention functions.

Drawn cup needle roller bearings are manufactured with two needle roller and cage assemblies. They have a lubricating hole in the outer ring. Metric series drawn cup bearings with one needle roller and cage assembly may be made available on request with a lubricating hole, indicated by suffix AS1.

#### SEALED BEARINGS

The HK Series drawn cup bearings are offered with integral seals. The tables of dimensions on page C50 indicates those sizes available with lip contact seals. The seal lip design achieves a light and constant contact with the inner raceway throughout the range

of mounted bearing clearances thereby ensuring positive sealing and low frictional drag.

Sealed drawn cup bearings are intended to retain grease or non-pressurized oil within a bearing while also preventing contaminants entering the raceway area.

Details of shaft design for sealed bearings are given in the engineering section of this catalog.

The standard lip contact seals are compatible with common lubricating oils and petroleum based fuels, but they are adversely affected by certain fire-resistant hydraulic fluids and most common solvents. Sealed drawn cup bearings are normally filled with a high quality lithium soap base general purpose grease. The seal material and grease properties limit the bearing operating temperature between -30° C and +100° C.

If the operating temperature must be outside of the range for the seals mentioned here, or if the seals are exposed to unusual fluids please consult your Timken automotive representative.

## BEARING MOUNTING FITS AND INTERNAL CLEARANCE

Drawn cup bearings are manufactured to a degree of precision that will satisfy the radial clearance requirements of most applications. The total radial clearance for an installed drawn cup bearing results from the build up of manufacturing tolerances of the housing bore, the inner raceway diameter and the bearing, as well as the minimum radial clearance required for the application.

For metric series drawn cup bearings requiring close control of radial internal clearance, the suggested housing bore tolerance is N6 and h5 tolerance for the inner raceway diameter. When such exacting close control of radial internal clearance is not required, the user may select N7 housing bore and h6 inner raceway diameter tolerances.

## TOLERANCES FOR HOUSING MATERIALS OF LOW RIGIDITY

Metric series drawn cup bearings used in housings made from materials of low rigidity or steel housings of small section, the suggested housing bore tolerance is R6 (R7). To maintain normal radial internal clearance the inner raceway diameter tolerance should be h5 (h6).

## OUTER RING ROTATION

For metric series drawn cup bearing applications where the outer ring rotates with respect to the load, it is suggested that both the housing bore and the inner raceway diameter be reduced using R6 (R7) and f5 (f6) tolerance practice respectively.

## OSCILLATING MOTION

Metric series drawn cup bearing applications involving oscillating motion may require reduced radial internal clearances. This reduction may be accomplished by increasing the inner raceway diameter using j6 tolerance.

## INNER RINGS

When it becomes impractical to meet the shaft raceway design requirements (hardness, case depth, surface finish etc.) outlined in the engineering section, standard inner rings may be used with metric series drawn cup bearings. It is suggested that when metric series inner rings are used with metric series drawn cup bearings, they should be mounted with a loose transition fit on the shaft using g6 (g5) shaft diameter tolerance. The inner ring should be end-clamped against a shoulder. If a tight transition fit must be used, [shaft diameter tolerance h6 (h5)], to keep the inner ring from rotating relative to the shaft, the inner ring outside diameter, as mounted, must not exceed the raceway diameter required by the drawn cup bearing for the particular application. In case the outside diameter of the inner ring, when mounted on the shaft, exceeds the required raceway diameter for the matching drawn cup bearing, it should be ground to proper diameter while mounted on the shaft.

## LOAD RATING FACTORS

### DYNAMIC LOADS

Drawn cup needle roller bearings can accommodate only radial loads.

$$P = F_r$$

$P$  = The maximum dynamic radial load that may be applied to a drawn cup bearing based on the dynamic load rating,  $C$  given in the tabular pages. This load should be  $\leq C/3$ .

### STATIC LOADS

$$f_0 = \frac{C_0}{P_0}$$

$f_0$  – static load safety factor

$C_0$  – basic static load rating (kN)

$P_0$  – maximum applied static load (kN)

To ensure satisfactory operation of drawn cup needle roller bearings under all types of conditions the static load safety factor  $f_0$  should be  $\geq 3$ .

## ADJUSTED RATING LIFE

When application data includes details of operating temperature, oil viscosity, operating speed and the applied load meets the  $\leq C/3$  condition adjusted rating life may be evaluated using the information given in the engineering section of this catalog.

## NEEDLE ROLLER BEARINGS

### INSPECTION OF DRAWN CUP NEEDLE ROLLER BEARINGS

Although the bearing cup is accurately drawn from strip steel, because of its fairly thin section it may go out of round during heat treatment. When the bearing is pressed into a true round housing or ring gage, of correct size and wall thickness, it becomes round and is sized properly. For this reason, it is incorrect to inspect an unmounted drawn cup bearing by measuring the outside diameter. The correct method for inspecting the bearing size is to:

1. press the bearing into a ring gage of proper size
2. plug the bearing bore with the appropriate "go" and "no go" gages or measure it with a tapered arbor (lathe mandrel)

The "go" gage size is the minimum needle roller complement bore diameter. The "no go" gage size is larger than the maximum needle roller complement bore diameter by 0.002 mm.

TABLE 1 – HK SERIES BEARINGS

| Nominal Bore Diameter mm | Ring Gage * | Dimensions – mm<br>Needle Roller Complement Bore Diameter |        |
|--------------------------|-------------|-----------------------------------------------------------|--------|
|                          |             | Min.                                                      | Max.   |
|                          |             | <b>F<sub>ws min</sub></b>                                 |        |
| 3                        | 6.484       | 3.006                                                     | 3.024  |

\*The ring gage sizes are in accordance with ISO N6 lower limit.

### INSTALLATION PROCEDURES

#### GENERAL INSTALLATION REQUIREMENTS

- A drawn cup bearing must be pressed into its housing.
- An installation tool, similar to the one illustrated, must be used in conjunction with a standard press.
- The bearing must not be hammered into its housing even in conjunction with the proper assembly mandrel.
- The bearing must not be pressed tightly against a shoulder in the housing.
- If it is necessary to use a shouldered housing, the depth of the housing bore must be sufficient to ensure that the housing shoulder fillet, as well as the shoulder face, clears the bearing.
- The installation tool must be coaxial with the housing bore.

### INSTALLATION OF OPEN END BEARINGS

It is advisable to utilize a positive stop on the press tool to locate the bearing properly in the housing. The assembly tool should have a leader or a pilot, as shown, to aid in starting the bearing true in the housing. The "O" ring shown on the drawing may be used to assist in holding the bearing on the installation tool. The bearing should be installed with the marked end (the end with the identification markings) against the angled shoulder of the pressing tool.

- A – 0.4 mm less than housing bore
- B – 0.08 mm less than shaft diameter
- C – distance bearing will be inset into housing, minimum of 0.2 mm
- D – pilot length should be length of bearing less 0.8 mm
- E – approximately  $\frac{1}{2}$  D

### INSTALLATION OF CLOSED END BEARINGS

Bearing can be piloted from below for installation.

### EXTRACTION FROM A STRAIGHT HOUSING

Bearing can be extracted by pushing it through the housing. After extraction, the drawn cup bearing should not be reused.

## NEEDLE ROLLER BEARINGS

### DRAWN CUP NEEDLE ROLLER BEARINGS –

#### INCH SERIES

When a rolling bearing is needed for a compact and economical design where it is not practical to harden and grind the housing bore, or where the housing materials are of low rigidity such as cast iron, aluminum or even plastics, drawn cup needle roller bearings should be considered.

#### REFERENCE STANDARDS

- **ANSI/ABMA 18.2** - Needle roller bearings - Radial, inch design.

Before selecting specific inch series drawn cup needle roller bearings, the engineering section of this catalog should be reviewed.

#### TYPES OF INCH SERIES DRAWN CUP NEEDLE ROLLER BEARINGS

**B**

Full complement bearings

**M**

**J**

Caged bearings

**JTT**

#### IDENTIFICATION

The prefix letter or letters in inch series drawn cup bearing designation denote whether the bearings are made with a full complement of needle rollers or caged needle rollers. The use of full complement of needle rollers is indicated by the prefix code letter B and for use of caged needle rollers by the prefix code letter J.

Inch bearings are available in either of two radial cross-sections. The larger cross-section is indicated by the prefix code letter H. Absence of the letter H indicates the smaller radial cross section.

These major features of dimension and construction are summarized in Table 1.

In addition, there can be other identifying letters which cover special modification. Please consult your Timken representative when special modifications are required.

Since the entire identification code in the bearing designation may not appear on the bearing itself, the manufacturer's parts list or another reliable source should always be consulted when ordering bearings for service or field replacement to make certain that the correct bearing with the correct lubricant is used.

TABLE 1 – IDENTIFYING LETTERS – INCH SERIES

|                                         | Prefix letters in Bearing Designation |               |
|-----------------------------------------|---------------------------------------|---------------|
|                                         | Smaller Roller                        | Larger Roller |
| Full complement (mechanically retained) | B                                     | BH            |
| Caged                                   | J                                     | JH            |

Other prefix letters denoting major construction features are:

- M – closed end style
- P – open end (finger)cage
- T – single seal
- TT – double seal
- G – extra-precision

#### CONSTRUCTION

##### FULL COMPLEMENT BEARINGS

The original drawn cup needle roller bearing employs a full complement of needle rollers. The full complement drawn cup bearing combines maximum load carrying capability and low cost with the advantages of the drawn outer ring.

The inward turned lips of the cup are used to mechanically

retain the full complement of needle rollers, providing their positive radial retention even though it may be necessary to remove the shaft repeatedly during servicing of the mechanism employing the bearing.

Full Complement Bearing

Caged Bearing

### CAGED BEARINGS

The one-piece steel cage, used in most Timken® Torrington® caged drawn cup bearings, is designed to provide rigidity and minimize wear. This cage design separates the roller guiding and roller retention functions. The portions of the cage that retain the rollers cannot contact the rollers while the bearing is operating. Thus, there is no wear which might affect roller retention.

The cage contacts the rollers only near their ends at the roller pitch line, so accurate guidance is achieved with least effort. Pitch line guidance at the ends of the rollers prevents skewing and assures roller stability, with little stress on the cage itself. The design minimizes the contact area and force required for roller guidance, and thus minimizes drag between cage and rollers.

The same design feature which assures no contact between roller retention bars and rollers while the bearing is operating also provides ample clearance along the length of the roller to enhance the circulation of lubricant.

Timken also has available bearings with other cage designs. Bearings with engineered polymer cages are for use where operating conditions permit. Before applying bearings with engineered polymer cages, please consult your Timken representative.

### SEALED BEARINGS

Drawn cup caged needle roller bearings are offered with integral seals. The tables of dimensions on pages C90-C91 indicate those sizes available with lip contact seals which limit the bearing operating temperature between -25° F and 225° F. The seal lip design achieves a light and constant contact with the shaft throughout the range of mounting bearing clearances thereby ensuring positive sealing and low frictional drag.

Sealed drawn cup bearings are intended to retain grease or non-pressurized oil within a bearing while also preventing contaminants from entering the raceway area.

Details of shaft design for sealed bearings are given in the engineering section.

The standard lip contact seals are compatible with common lubricating oils and petroleum based fuels, but they are adversely affected by certain fire-resistant hydraulic fluids and most common solvents.

If the operating temperature must be outside of the specified range, or if the seals are exposed to unusual fluids, please consult your Timken representative.

## DIMENSIONAL ACCURACY AND MOUNTING DIMENSIONS

### MANUFACTURING TOLERANCES AND RESULTING CLEARANCES

### BEARING MOUNTING FITS AND RADIAL INTERNAL CLEARANCE

Drawn cup bearings are manufactured to a degree of precision that will satisfy the radial clearance requirements of most applications. The total radial clearance of an installed drawn cup bearing results from the build up of manufacturing tolerances of the housing bore, inner raceway O.D. and the bearing, as well as the minimum radial clearance required for the application.

For bearings of nominal inch dimensions, the suggested mounting dimensions will provide correct running clearance for most applications. Closer control of radial clearance would be governed by the user's capability of holding housing and shaft raceway dimensional tolerances tighter than the limits shown on the tabular pages.

The drawing illustrates the manufacturing tolerances and resulting clearances applying to medium size drawn cup bearings in rotating applications when using the suggested tabulated mounting dimensions.

Radial clearance in a mounted bearing may be more closely controlled by reducing the manufacturing tolerances of the housing bore and inner raceway diameter. Where extremely close control of radial clearance is required for bearings of nominal inch dimensions, extra-precision full complement bearings are available (see page C80).

## NEEDLE ROLLER BEARINGS

### TOLERANCES FOR HOUSING MATERIALS OF LOW RIGIDITY

For housing materials of low rigidity, or steel housings of small section, it is suggested that for initial trial the housing bore diameters given in the tabular pages be reduced by the amounts shown in Table 3. To maintain normal radial internal clearance, the inner raceway diameter tolerance given in the tabular pages should be used.

TABLE 3 –  
LOW RIGIDITY HOUSING BORE

| Nom. Housing Bore<br>inch |       |      |       | Subtract<br>inch |       |
|---------------------------|-------|------|-------|------------------|-------|
| mm                        |       | inch |       | mm               | inch  |
| over                      | incl. | over | incl. |                  |       |
| 0                         | 9.5   | 0    | .38   | .010             | .0004 |
| 9.5                       | 25.4  | .38  | 1.00  | .015             | .0006 |
| 25.4                      | 50.8  | 1.00 | 2.00  | .025             | .0010 |
| 50.8                      | 76.2  | 2.00 | 3.00  | .030             | .0012 |
| 76.2                      | 152.4 | 3.00 | 6.00  | .036             | .0014 |

### OUTER RING ROTATION

For applications where the outer ring rotates with respect to the load, it is suggested that both the housing bore and inner raceway diameter be reduced. Bearings of nominal inch dimensions should have the housing bore and inner raceway diameters reduced by .0005 in.

### OSCILLATING MOTION

Applications involving oscillating motion often require reduced radial clearances. This reduction is accomplished by increasing the shaft raceway diameters as shown in Table 4.

TABLE 4 –  
NOMINAL INCH BEARING OSCILLATING SHAFT SIZE

| Shaft Size    |              | Add  |       |
|---------------|--------------|------|-------|
| mm            | inch         | mm   | inch  |
| 2.38 to 4.76  | .094 to .188 | .008 | .0003 |
| 6.35 to 47.62 | .25 to 1.875 | .013 | .0005 |
| 50.8 to 139.7 | 2 to 5.5     | .015 | .0006 |

### INNER RINGS

Where it becomes impractical to meet the shaft raceway design requirements (hardness, case depth, surface finish, etc.) outlined in the general engineering section, standard inner rings for drawn cup bearings are available. These are tabulated on pages C92 of the drawn cup section.

Inner rings for drawn cup bearings are designed to be a loose transition fit on the shaft and should be clamped against a shoulder. If a tight transition fit must be used to keep the inner ring from rotating relative to the shaft, the inner ring O.D., as mounted, must not exceed the raceway diameters required by the drawn cup bearing for the particular application. See the previous discussion on internal clearances and fits for further details on inner raceway diameter choice.

### LUBRICATION

Inch series drawn cup bearings can be furnished with an oil hole (centered in the drawn cup) to facilitate relubrication. If desired, specify on order by adding an -OH suffix to the bearing designation.

### LOAD RATING FACTORS DYNAMIC LOADS

Drawn cup needle roller bearings can accommodate only radial loads.

$$P = F_r$$

P = The maximum dynamic radial load that may be applied to a drawn cup bearing based on the dynamic load rating, C given in the tabular pages. This load should be  $\leq C/3$ .

### STATIC LOADS

$$f_0 = \frac{C_0}{P_0}$$

$f_0$  – static load safety factor

$C_0$  – basic static load rating

$P_0$  – maximum applied static load

To ensure satisfactory operation of drawn cup needle roller bearings under all types of conditions the static load safety factor  $f_0$  should be  $\geq 3$ .

### ADJUSTED RATING LIFE

When application data includes details of operating temperature, oil viscosity, operating speed and the applied load meets the  $\leq C/3$  condition adjusted rating life may be evaluated using the information given in the engineering section.

**INSPECTION PROCEDURES**

Although the bearing cup (outer ring) is accurately drawn from strip steel it may go out of round during heat treatment. When the bearing is pressed into a true, round housing or ring gage of correct size and wall thickness, it becomes round and is sized properly. For this reason, it is incorrect to inspect an unmounted drawn cup bearing by measuring the O.D. The correct method for inspecting the bearing size is to:

1. press the bearing into a ring gage of proper size.
2. plug the bearing bore with the appropriate "go" and "no go" gages.

Table 2 provides the correct ring and plug gage diameters for inspecting Torrington drawn cup needle roller bearings. When the letter H appears in the columns headed "Bearing Bore Designation" and "Nominal Shaft Diameter", the gage sizes listed are for the larger cross section bearings which include H in their bearing designation prefix.

**EXAMPLE**

Find the ring gage and plug gage dimensions for a BH-68 bearing.

The nominal bore diameter ( $F_w$ ) for this bearing, as shown in the table of dimensions on this page, is .3750". Since the letter H appears in the bearing designation, the following information will be found opposite H6 .3750" in Table 2.

|                                     | inch  |
|-------------------------------------|-------|
| ring gage                           | .6255 |
| diameter under needle rollers, min. | .3765 |
| diameter under needle rollers, max. | .3774 |

The "go" plug gage is the same size as the minimum needle roller complement bore diameter and the "no go" plug gage size is .0001" larger than the maximum bore diameter. Therefore the correct ring and plug gage dimensions are:

|                    | inch  |
|--------------------|-------|
| ring gage          | .6255 |
| plug gage, "go"    | .3765 |
| plug gage, "no go" | .3775 |

These same gage dimensions also apply to JH-68.

**TABLE 2 – INCH SERIES BEARINGS**

| Bearing Bore Designation | Nominal Shaft Diameter | Nominal Bore Diameter | Ring Gage | Dimensions - inch                      |        |
|--------------------------|------------------------|-----------------------|-----------|----------------------------------------|--------|
|                          |                        |                       |           | Needle Roller Complement Bore Diameter |        |
| inch                     |                        |                       |           | min.                                   | max.   |
| 2                        | 1/8                    | .1250                 | .2505     | .1258                                  | .1267  |
| 2 1/2                    | 5/32                   | .1562                 | .2817     | .1571                                  | .1580  |
| 3                        | 3/16                   | .1875                 | .3437     | .1883                                  | .1892  |
| 4                        | 1/4                    | .2500                 | .4380     | .2515                                  | .2524  |
| 5                        | 5/16                   | .3125                 | .5005     | .3140                                  | .3149  |
| H 5                      | H 5/16                 | .3125                 | .5630     | .3140                                  | .3149  |
| 6                        | 3/8                    | .3750                 | .5630     | .3765                                  | .3774  |
| H 6                      | H 3/8                  | .3750                 | .6255     | .3765                                  | .3774  |
| 7                        | 7/16                   | .4375                 | .6255     | .4390                                  | .4399  |
| H 7                      | H 7/16                 | .4375                 | .6880     | .4390                                  | .4399  |

Bearing bore should be checked with "go" and "no go" plug gages. The "go" gage size is the minimum needle roller complement bore diameter. The "no go" gage size is larger than the maximum needle roller complement bore diameter by 0.0001".

## NEEDLE ROLLER BEARINGS

### INSTALLATION OF DRAWN CUP BEARINGS

#### GENERAL INSTALLATION REQUIREMENTS

- A drawn cup bearing must be pressed into its housing.
- An installation tool, similar to the ones shown, must be used in conjunction with a standard press.
- The bearing must not be hammered into its housing, even in conjunction with the proper assembly mandrel.
- The bearing must not be pressed tightly against a shoulder in the housing.
- If it is necessary to use a shouldered housing, the depth of the housing bore must be sufficient to ensure the housing shoulder fillet, as well as the shoulder face, clears the bearing.
- The installation tool must be coaxial with the housing bore.

C

### INSTALLATION OF OPEN END BEARINGS

It is advisable to utilize a positive stop on the press tool to locate the bearing properly in the housing. The assembly tool should have a leader or a pilot, as shown, to aid in starting the bearing true in the housing. The ball detent shown on the drawing is used to assist in aligning the rollers of a full complement bearing during installation and to hold the bearing on the installation tool. A caged type drawn cup bearing does not require a ball detent to align its rollers. The

ball detent may still be used to hold the bearing on the installation tool or an "O" ring may be used as shown in the drawing on page C41. The bearing should be installed with the marked end (the end with identification markings) against the angled shoulder of the pressing tool.

- A –  $\frac{1}{64}$ " less than housing bore
- B – .003" less than shaft diameter
- C – distance bearing will be inset into housing, minimum of .008"
- D – pilot length should be length of bearing less  $\frac{1}{32}$ "
- E – approximately  $\frac{1}{2}$  D

### INSTALLATION OF CLOSED END BEARINGS

The installation tool combines all the features of the tool used to install open end bearings, but the pilot is spring loaded and is part of the press bed.

The angled shoulder of the pressing tool should bear against the closed end with the bearing held on the pilot to aid in starting the bearing true in the housing.

- A** –  $\frac{1}{64}$ " less than housing bore
- B** – .003" less than shaft diameter
- C** – distance bearing will be inset into housing, minimum of .008"

### EXTRACTION OF DRAWN CUP BEARINGS

The need to extract a drawn cup bearing does not arise often. Standard extractor tools may be purchased from a reputable manufacturer. Customers may produce the special extraction tools at their own facilities. In certain cases, The Timken Company may assist, particularly when a drawn cup bearing appears to be damaged and a full analysis is required. After extraction, the drawn cup bearing should not be reused.

#### EXTRACTION FROM A STRAIGHT HOUSING

When it is necessary to extract a drawn cup bearing from a straight housing, a similar tool to the installation tool, but without the stop, may be used. To avoid damage to the bearing, pressure should be applied against the marked end of the bearing, just as it is done at installation.

## NEEDLE ROLLER BEARINGS

### EXTRACTION FROM A SHOULDERED OR DEAD END HOUSING (with space between the bearing and the housing shoulder)

Bearings may be extracted from shouldered or dead end housings with a common bearing puller tool as shown. This type of tool is slotted in two places at right angles to form four prongs. The four puller prongs are pressed together and inserted into the space between the end of the bearing and the shoulder. The prongs are forced outward by inserting the expansion rod, and then the bearing is extracted. Do not reuse the bearing after extraction.

C

**EXTRACTION FROM A SHOULDERED HOUSING (with bearing pressed up close to the shoulder)**

The tool to be used, as shown, is of a similar type described for a shouldered or dead end housing, but the rollers must first be removed from the bearing.

The four segment puller jaws are collapsed and slipped into the empty cup. The jaws are then forced outward into the cup bore by means of the tapered expansion rod. The jaws should bear on the lip as near as possible to the cup bore. The cup is then pressed out from the top.

Section A-A of Four Jaws

# NEEDLE ROLLER BEARINGS

## FULL COMPLEMENT BEARINGS, OPEN ENDS, CLOSED ONE END

### INCH SERIES

**B, BH**

**M-1, MH-1**

**Full Complement Bearing**

Drawn cup bearings of nominal inch dimensions, with one closed end, that are not tabulated, may be made available upon request.

Mounting dimensions are based on the inner ring rotating and the outer ring being stationary relative to the load. The housing should be of high strength material. See engineering section for discussion of shaft and housing design.

# NEEDLE ROLLER BEARINGS

## FULL COMPLEMENT BEARINGS, OPEN ENDS, CLOSED ONE END — *continued*

### INCH SERIES

Drawn cup bearings of nominal inch dimensions, with one closed end, that are not tabulated, may be made available upon request.

Mounting dimensions are based on the inner ring rotating and the outer ring being stationary relative to the load. The housing should be of high strength material. See engineering section for discussion of shaft and housing design.

# NEEDLE ROLLER BEARINGS

## FULL COMPLEMENT BEARINGS, OPEN ENDS, CLOSED ONE END – *continued*

### INCH SERIES

**B, BH**

**M-1, MH-1**

**Full Complement Bearing**

Drawn cup bearings of nominal inch dimensions, with one closed end, that are not tabulated, may be made available upon request.

Mounting dimensions are based on the inner ring rotating and the outer ring being stationary relative to the load. The housing should be of high strength material.

See engineering section for discussion of shaft and housing design.

# NEEDLE ROLLER BEARINGS

## FULL COMPLEMENT BEARINGS, OPEN ENDS, CLOSED ONE END — *continued*

### INCH SERIES

Drawn cup bearings of nominal inch dimensions, with one closed end, that are not tabulated, may be made available upon request.

Mounting dimensions are based on the inner ring rotating and the outer ring being stationary relative to the load. The housing should be of high strength material. See engineering section for discussion of shaft and housing design.

# NEEDLE ROLLER BEARINGS

## FULL COMPLEMENT BEARINGS, OPEN ENDS, CLOSED ONE END – *continued*

### INCH SERIES

**B, BH**

**M-1, MH-1**

**Full Complement Bearing**

Drawn cup bearings of nominal inch dimensions, with one closed end, that are not tabulated, may be made available upon request.

Mounting dimensions are based on the inner ring rotating and the outer ring being stationary relative to the load. The housing should be of high strength material. See engineering section for discussion of shaft and housing design.

# NEEDLE ROLLER BEARINGS

## FULL COMPLEMENT BEARINGS, OPEN ENDS, CLOSED ONE END — *continued*

### INCH SERIES

Drawn cup bearings of nominal inch dimensions, with one closed end, that are not tabulated, may be made available upon request.

Mounting dimensions are based on the inner ring rotating and the outer ring being stationary relative to the load. The housing should be of high strength material. See engineering section for discussion of shaft and housing design.
